

POGIL - Gene Expression: Transcription

How is mRNA synthesized and what message does it carry?

Why?

Deoxyribonucleic DNA is often referred to as a genetic blueprint. In the same way that blueprints contain the instructions for construction of a building, the DNA found inside the nuclei of cells contains the instructions for assembling a living organism. The DNA blueprint carries its instructions in the form of genes. In most cases the genes direct the production of a polypeptide, from which other more complex proteins, such as enzymes or hormones, may be constructed. These polypeptides and other molecules run the organism's metabolism and, in multicellular

organisms, dictate what each cell's job is. So, what is the language of these instructions and how are they read and decoded by the cellular organelles? This activity will focus on the decoding of genes in eukaryotes.

Model 1 - Transcription

1. Consider the eukaryotic cell in Model 1.

a. Where in the cell is the DNA found?

b. Where in the cell does transcription take place?

2. Refer to Model 1.

a. What polymer is synthesized during transcription?

b. What monomers are used to construct this polymer and where are they found?

3. According to Model 1, what enzyme is required for transcription? (*Hint: Think about how enzymes are named. What ending is used for enzyme names?*)

4. Refer to Model 1.

a. What is the base-pair rule for a DNA strand matching an RNA strand?

b. Compare this base-pair rule with that of two DNA strands.

5. Which strand of the DNA contains the "blueprint" for the pre-mRNA?

6. Consider Model 1.

a. In which direction is the DNA molecule read? _____

b. The DNA strand and pre-mRNA strand are anti-parallel. With this in mind label the 3' and 5' ends of the pre-mRNA strand in Model 1.

c. In which direction is the pre-mRNA molecule constructed? _____

7. Before printing presses were available, books had to be transcribed in order to share the information

Translation Protocols provides many detailed experimental procedures for prokaryotic transcription and translation systems together with protocols for many key techniques used in the analysis of eukaryotic transcription. In keeping with the successful format of preceding volumes of the Methods in Molecular Biology series, step by step instructions are provided together with extensive notes that cover troubleshooting and special tips considered important. Translation Factors in Control of Gene Expression, 1997. *A Multi-level Approach to Understanding the Regulation of Translation Initiation* Heather Rochelle Keys, 2016. mRNA translation is an extremely complex process required for life. Translation consumes vast amounts of cellular resources and organisms have evolved tight regulatory mechanisms to control this process which are often deregulated in cancer and other disease states. Initiation as the rate limiting step in translation is particularly well regulated. Two kinase pathways that respond to cellular stresses, the GCN2 and mTORC1 pathways, sense amino acid insufficiency to inhibit translation initiation at distinct points. GCN2 is activated in response to amino acid deprivation and inhibits formation of the ternary complex comprising eIF2 GTP and the initiator methionyl tRNA which is required for recognition of the start codon. Although translation of most mRNAs is greatly suppressed when GCN2 is activated, mRNAs with certain cis elements escape inhibition. In contrast, the mTORC1 pathway is inhibited by the lack of amino acids which ultimately results in the disruption of eIF4F, a multiprotein initiation factor complex that coordinates the recruitment of the small ribosomal subunit to the 5' end of mRNA. Like a decrease in the amount of ternary complex, disruption of eIF4F also suppresses translation of most mRNAs; however, the translation of a subset of mRNAs harboring a 5' TOP motif is even more dramatically reduced when mTORC1 is inhibited. Here we describe the translational program downstream of amino acid insufficiency and present evidence of a novel uORF in murine ATF4 whose ribosome occupancy is regulated by the presence of amino acids. We identify the 4EBPs as the mTORC1 substrates that mediate the major effects of mTORC1 inhibition on translation of mRNAs both globally and on 5' TOP mRNAs specifically. Although we cannot mechanistically explain the dependence of 5' TOP mRNA translation on mTORC1 activity, we uncover a surprising role of the cap proximal sequence in eIF4E recruitment. We systematically assess how the juxta-cap sequence modulates eIF4E binding and translation and present a model whereby the juxta-cap sequence dictates the cap proximal RNA secondary structure in an mRNA context dependent manner. *Translation Pausing* Cameel H. Transcription and translation U Satyanarayana, 2014-11-07. *Transcription and translation* Post-transcriptional Control of Gene Expression Orna Resnekov, Alexander von Gabain, 2011-10-12. Many important cellular processes rely on posttranscriptional control of gene expression. This book describes the mechanisms of gene expression at this level that occur in the cytoplasm of prokaryotes and eukaryotes. Several introductory chapters discuss the general principles of translation and mRNA stability. The interactions of mature mRNA with the translational machinery, the components of mRNA degradation and antisense RNA are surveyed. Subsequent chapters discuss protein folding, transport, modification and degradation. The book is an invaluable

source of information for both newcomers and those wishing an overview of the field

Probing Determinants of Start Codon Selection for Translation Initiation Mohammed Husain Mohsin Bharmal, 2021 Bacterial translation comprising of three steps initiation elongation and termination is a highly energy intensive step of which translation initiation is very important for fidelity of gene expression This is because the canonical start codon AUG complements both initiator and elongator methionyl tRNAs making it important for ribosome to distinguish the start AUG codon from elongator AUG codons which is thought to be mediated by base pairing of the Shine Dalgarno SD sequence in the mRNA 5' UTR and the complementary anti SD sequence in the 16S rRNA of the 30S subunit of ribosome However this mechanism was proposed based on the sequence information of few E coli phage mRNAs and 16S rRNA sequence of E coli The complementary anti SD sequence was found to be present in E coli and few other bacteria of which 16S rRNA was later sequenced and therefore this mechanism was assumed to be present universally However with advancement in sequencing technologies several high throughput studies have showed that SD Anti SD base pairing is not essential for start codon selection and transcriptomics has revealed that non SD mRNAs which lack a SD sequence in the 5' UTR and leaderless mRNAs which completely lack any 5' UTR are broadly distributed across bacteria including the model organism *Caulobacter crescentus* which contains only 30% of mRNAs having SD and can initiate translation in the absence of the SD sequence Hence to explain how the mRNA translation initiates in the absence of SD sequence another mechanism 0 unique accessibility hypothesis0 which assumes that the TIRs are more accessible less RNA secondary structure as compared to the other regions of the mRNA has been proposed and tested computationally and experimentally in various organisms To test this hypothesis in *C. crescentus* we performed computational analysis to compute the accessibility of the TIRs and other regions of mRNAs using a metric 4Gunfold which revealed similar observations indicating importance of TIR accessibility for translation initiation and correct start codon selection Further to systematically test the effects of accessibility and other factors on leaderless start codon identity and presence of short leaders and leadered mRNA translation initiation presence of SD sequences which is not looked into synthetic in vivo translation initiation reporters were designed that ensured translation of the reporter gene only from the AUG codon in the TIR allowing the control of the TIR region Translation efficiency values calculated using RNA seq and ribosome profiling data were used to test the effect of these factors on translation initiation of natural mRNAs Using these data it was found that start codon accessibility is a key determinant in correct start codon selection and initiating translation from the TIR while leader length and start codon identity impacts leaderless mRNA translation initiation efficiency and presence of SD influences leadered mRNA translation initiation efficiency in bacteria

Translational Regulation of Gene Expression 2 J. Ilan, 2011-10-12 This book which results from the dramatic increase in interest in the control mechanism employed in gene expression and the importance of the regulated proteins presents new information not covered in *Translational Regulation of Gene Expression* which was published in 1987 It is not a revision of the earlier book

but rather an extension of that volume with special emphasis on mechanism. As the reader will discover there is enormous diversity in the systems employing genes for translational regulation in order to regulate the appearance of the final product the protein. Thus we find that important proteins such as protooncogenes, growth factors, stress proteins, cytokines, lymphokines, iron storage and iron uptake proteins and a panorama of prokaryotic proteins as well as eukaryotic viral proteins are translationally regulated. Since for some gene products the degree of control is greater by a few orders of magnitude than their transcription we can state that for these genes at least the expression is translationally controlled. Translational regulation of gene expression in eukaryotes has emerged in the last few years as a major research field. The present book describes mechanisms of translational regulation in bacteria, yeast and eukaryotic viruses as well as in eukaryotic genes. In this book we try to provide in depth coverage by including important examples from each group rather than systematically including all additional systems not described in the previous volume.

Functional and Structural Mapping of 5' UTR Cis-regulatory Elements that Control Translation Gun Woo Byeon, 2021

Translation can be critically and pervasively regulated in a transcript specific manner to modulate protein synthesis. However it is poorly understood which and how cis regulatory features of the messenger ribonucleic acid mRNA encode variable transcript specific translation rates to impact spatiotemporal gene expression patterns. Here I address the role of 5' untranslated 5' UTR in regulating mRNA translation in vertebrate species. In the first part of the dissertation I explore the phenomenon of extreme non coding sequence conservation in vertebrate genomes at the level of RNA function in 5' UTRs. Extreme conservation is a fascinating mystery in comparative genomics in which sequence conservation at levels often greater than coding regions with invariant polypeptide sequences stretches on for hundreds of nucleotides in the non coding regions of the genome. While extreme conservation has been extensively studied for its role in transcriptional regulation its RNA level function in translational regulation remains largely unknown. This work reveals the role of extremely conserved 5' UTRs in translational regulation of genes linked to the emergence of essential developmental features in vertebrate species. Extremely conserved 5' UTRs are found to contain cis elements that promote cell type specific non canonical translation initiation. As these elements function as RNA molecules an understanding of their structures is essential. To this end I develop in cell mutagenesis and map icM2 a methodology that maps RNA structure using high throughput mutational analysis inside cells. icM2 maps the ensemble of multiple conformations in an extremely conserved 5' UTR which is found to be important for its translational regulatory function. I find that active RNA structural remodeling inside cells by RNA helicase activity maintains the relative balance of the conformations. Furthermore cellular structural remodeling occurs frequently in the most conserved regions of the 5' UTRs. I propose a structural explanation for extreme conservation at the level of RNA and highlight the importance of comparative genomics and of RNA structure in understanding 5' UTR function and evolution. In the second part of the dissertation I explore the genome wide role of mammalian ribosome expansion segments ES in interacting with 5' UTRs to regulate mRNA

translation ESs are eukaryote specific insertions to the ribosomal ribonucleic acid rRNA. They are positioned mostly at the exterior surface of the ribosome structure extending from the core of the ribosome like flexible tentacles. It has been recently shown that the mammalian ES9S in 18S rRNA directly interacts with a Hox gene 5' UTR element to promote its translation. Direct rRNA-mRNA interaction is not a widely recognized paradigm for translation initiation in eukaryotes. However, addressing the potential genome-wide significance of such a mechanism mediated by ribosome ESs and mRNA 5' UTRs is challenging. Since rRNAs are transcribed from tandem repeats of ribosomal DNA units that can range up to hundreds of thousands of copies, it has not been possible to directly manipulate ESs in most species. To solve this problem, I develop VELCRO IP RNA-seq, variable expansion segment ligand chimeric ribosome immunoprecipitation RNA sequencing. VELCRO IP RNA-seq interrogates the interaction of a ribosome ES with mRNA elements genome-wide by combining yeast genetics, in vitro biochemical pull-down, and high throughput sequencing. By applying VELCRO IP RNA-seq on mammalian ES9S, hundreds of mRNA regions that interact with the ribosome via specific interaction with the ES are identified. Furthermore, the 5' UTR targets of ES9S are found to promote non-canonical translation. A number of short k-mers that have Watson-Crick complementary to ES9S subsequences are overrepresented in its targets, suggesting potential importance of canonical base pairing. These results provide evidence for the usage of direct mRNA-rRNA interaction as a mechanism of translation initiation on a wider scale than previously imagined for vertebrate species. Finally, in the last chapter, I discuss how my findings can shape future investigations into the remaining unanswered questions on 5' UTR regulation of translation. Altogether, this dissertation takes us a step closer to the ultimate goal of deciphering the code for translational regulation.

Quantitative Analysis of Mammalian Translation Initiation William Lewis Noderer, 2014. A fundamental goal of biology is to predict the protein expression from a genomic sequence. Any such quantitative proteomic prediction must account for the process of translation initiation, which defines the translational reading frame and directly affects the protein synthesis rate. In the eukaryotic scanning ribosome model, the small ribosomal subunit traverses the mRNA starting from the 5' cap in search of a start codon, which is typically an AUG. The likelihood of a ribosome recognizing and initiating at any given start codon is defined as the translation initiation site (TIS) efficiency. It is known that the mRNA sequence surrounding the start codon interacts with the scanning ribosome and impacts the TIS efficiency. The goal of this work is to quantitatively predict the efficiency of initiation for every possible translation initiation site that contains an AUG start codon. In order to analyze the large number of possible TIS sequences, we could not rely on traditional laboratory methods but instead had to develop a new technique called FACS-seq, which combines high throughput cell sorting and next generation DNA sequencing. We applied the FACS-seq method to a genetic fluorescence reporter representing all 65,536 possible TIS sequences spanning the 6 bases upstream and 2 bases downstream of the start codon. From our FACS-seq data, we found the TIS motif RYMRMVAUGGC to have the highest translation efficiency, where R = A or G, Y = C or U, M = A or C, and V = A, C, or G. However, by

fitting a dinucleotide position weight matrix to the TIS efficiency data it was shown that dinucleotide interactions which cannot be conveyed in a single TIS motif significantly impact the initiation efficiency Here FACS seq was applied to the study of translation initiation but in principle the method could be applied to any genetic library that uses a fluorescence reporter The FACS seq dataset combined with modeling enabled the prediction of translation initiation efficiency for any mRNA transcripts based solely on the sequence We first investigated how mutations near an annotated start codon altered gene expression thereby causing disease A collection of somatic TIS mutations found in tumor samples were screened to identify mutations that altered gene expression in a manner consistent with known tumor expression patterns Therefore the identified TIS mutations potentially drove the tumor formation by altering the protein synthesis rate Next we considered how leaky scanning past low efficiency TISs allows for initiation at down stream alternative sites Similar to transcriptional isoforms the translational isoforms resulting from alternative initiation sites expands the proteomic diversity with important biological consequences A quantitative leaky scanning model was used to predict mRNA transcripts with in frame alternative initiation sites which would generate truncated protein isoforms These predictions were supported experimentally by ribosome footprint profiling data In conclusion the extensive analysis of the TIS sequence space using FACS seq has improved our ability to quantitatively predict the efficiency and location of translation initiation

FAQs About Pogil Gene Expression Translation Key Books

How do I know which eBook platform is the best for me? Finding the best eBook platform depends on your reading preferences and device compatibility. Research different platforms, read user reviews, and explore their features before making a choice. Are free eBooks of good quality? Yes, many reputable platforms offer high-quality free eBooks, including classics and public domain works. However, make sure to verify the source to ensure the eBook credibility. Can I read eBooks without an eReader? Absolutely! Most eBook platforms offer webbased readers or mobile apps that allow you to read eBooks on your computer, tablet, or smartphone. How do I avoid digital eye strain while reading eBooks? To prevent digital eye strain, take regular breaks, adjust the font size and background color, and ensure proper lighting while reading eBooks. What the advantage of interactive eBooks? Interactive eBooks incorporate multimedia elements, quizzes, and activities, enhancing the reader engagement and providing a more immersive learning experience.
