

Investigation: Gross Anatomy of the Cat

- ☐ 1. A curtain of fat lies over most of the organs of the abdominal cavity; this is called the **greater omentum**. It can be removed so that organs are visible.
 - ☐ 2. The **liver** is the largest organ in the abdominal cavity, and it is divided into lobes.
 - ☐ 3. Push the liver upward to locate the **gallbladder** that lies underneath and find the **bile duct**, which connects the gallbladder to the **duodenum** of the small intestine.
 - ☐ 4. Locate the **diaphragm** which lies above the liver and separates the abdominal cavity from the thoracic cavity.
 - ☐ 5. The **lungs** are located on either side of the **heart** in the thoracic cavity. Are the lungs superior (above) or inferior (below) to the diaphragm?
 - ☐ 6. The lungs connect to the **trachea**, or the **windpipe**. It has cartilage rings that give it a ridged appearance. Locate the trachea and follow it toward the mouth. You will eventually find a rounded muscular area, the **larynx**, which is the cat's voice box (or "larynx box").
- What do you think will happen to the lungs if air is blown into the trachea? (Your instructor may demonstrate this for you.)
- ☐ 7. Locate the point at which the **esophagus** pierces the diaphragm and trace the esophagus to the stomach. Wiggling the stomach may help you find the esophagus. Trace it upward to where it is visible near the trachea.

Describe the appearance of the diaphragm, to what body system does it belong?

Describe the difference between the esophagus and the trachea.

What happens when air is blown into the trachea?

Label the diagrams.

ANS: Uploaded a photo of your cat with the liver, gallbladder, diaphragm, mesentery, stomach and spleen pinned and labeled.

indicates this is a book for use in a practical comparative anatomy course It is intended for a somewhat unusual class of student and consequently its contents outlook and method of treatment are unlike those of the standard texts in this subject As stated in the preface it is assumed that the student has already done a course in elementary zoology including the usual vertebrate types and has also examined in more detail a mammal Unless this mammal were man a number of comparisons in the book would be missed To obtain full benefit from it the student should obviously have taken the preliminary medical studies including a fair amount of human anatomy This is not meant to imply that the student of advanced zoology cannot get many useful hints and fresh points of view from its pages he undoubtedly can The types treated in a series of regional dissections are the lamprey the dogfish *Squalus Necturus* the lizard and the dog As it is intended for assistance in dissection information regarding osteology and the details of the central nervous system have been purposely omitted and conversely the muscles are treated somewhat more fully than is customary
