## Mammal Heart Dissection

**Purpose:** To examine the major features of a mammalian heart.

**Procedure:**

1. Observe the sheep heart ventral surface up (front) (See Figure 1 below).

Figure 1

Figure 2

2. On the outside of the heart is the visceral pericardium, which is a thin, transparent layer on the surface of the heart. Under this is the myocardium. Also note the abundance of fat along the paths of various blood vessels. This adipose tissue occurs in the loose connective tissue that underlies the visceral pericardium.

How can you tell which side of the heart is the ventral surface?

---

---

3. The line running diagonally down from the left side of the heart to the bottom right side of the heart is the anterior interventricular sulcus. Within this sulcus lies the largest branch of the coronary artery. The coronary artery supplies blood to the heart muscle tissue. The pointed bottom of the heart is called the apex.

What do you think is the purpose of the coronary artery and what results if there is blockage in this vessel? \_\_\_\_\_

---

4. Hearts from packing houses usually come with the major blood vessels trimmed very close to the heart itself. Although this is less than ideal, identification of the vessels and their entrances into the heart can easily be accomplished.

Identify the structures (1-4 are chambers, 5-10 are vessels) on the external surface of the heart in Figure 3:
