Research Handbook on Intellectual Property and the Life Sciences Duncan Matthews, Herbert Zech, 2017-06-30 Intellectual property (IP) is a key component of the life sciences, one of the most dynamic and innovative fields of technology today. At the same time, the relationship between IP and the life sciences raises new public policy dilemmas. The Research Handbook on Intellectual Property and the Life Sciences comprises contributions by leading experts from academia and industry to provide in-depth analyses of key topics including pharmaceuticals, diagnostics, and genes, plant innovations, stem cells, the role of competition law, and access to medicines. The Research Handbook focuses on the relationship between IP and the life sciences in Europe and the United States, complemented by country-specific case studies on Australia, Brazil, China, India, Japan, Kenya, South Africa, and Thailand to provide a truly international perspective.

Challenging Tradition Perry Shaw, Havilah Dharamraj, 2018-03-31 The surge of theological education in the rapidly growing church of the Majority World has highlighted the inadequacy of traditional Western methods of thinking and learning to fully accomplish the task at hand. The limitations of current theological education are embodied in the formation and assessment of the master's or doctoral dissertation processes that follow a linear empiricist tradition developed in the West and exported to the Majority World. Challenging Tradition: Innovation in Advanced Theological Studies highlights the need for these traditions to be reconsidered in every context throughout the world. Drs. Shaw and Dharamraj, with their team of contributors, present innovations in research and documentation that demonstrate how we may better prepare theological leadership through means that are contextually relevant and locally meaningful.

The Female Tradition in Physical Education David Kirk, Patricia Vertinsky, 2016-02-12 The Female Tradition in Physical Education re-examines a key question in the history of modern education why did the remarkably successful leaders of female physical education who pioneered the development of the subject in late nineteenth and early twentieth century England Canada Australia and New Zealand lose control in the years following the Second World War Despite the later resurgence of second wave feminism they never regained a voice with the result that male leadership was able to shift the curriculum in ways that neglected the needs and interests of girls and young women Drawing on new sources and a range of historiographical approaches and touching on related fields such as therapeutic exercise and dance the book examines the development of physical education for girls in a number of countries to offer an alternative explanation to the dominant narrative of the demise of the female tradition Providing an important contextualization for the state of contemporary female physical education this is fascinating reading for anybody with an interest in the development of sport and physical education women's and gender history and physical culture more generally

Abiotic Stress Signaling in Plants: Functional Genomic Intervention Girdhar K. Pandey, Manoj Prasad, Amita Pandey, Maik Boehmer, 2016-08-08 Abiotic stresses such as high temperature low temperature drought and salinity limit crop productivity worldwide Understanding plant responses to these stresses is essential for rational engineering of crop plants In Arabidopsis the signal transduction pathways for abiotic stresses light several phytohormones and pathogenesis have been elucidated A significant portion of plant genomes Arabidopsis and rice were mostly studied encodes for proteins involves in signaling such as receptor sensors kinases phosphatases transcription factors and transporters channels Despite decades of physiological and molecular effort knowledge pertaining to how plants sense and transduce low and high temperature low water availability drought water submergence microgravity and salinity signals is still a major question for plant biologist One major constraint hampering our understanding of these signal transduction processes in plants has been the lack or slow pace of application of molecular genomic and genetics knowledge in the form of gene function In the post genomic era one of the major challenges is investigation and understanding of multiple genes and gene families regulating a particular physiological and developmental aspect of plant life cycle One of the important physiological processes is regulation of stress response which leads to adaptation or adjustment in response to adverse stimuli With the holistic understanding of the signaling pathways involving not only one gene family but multiple genes or gene families plant biologist can lay a foundation for designing and generating future crops which can withstand the higher degree of environmental stresses especially abiotic stresses which are the major cause of crop loss throughout the world without losing crop yield and productivity Therefore in this e Book we intend to incorporate the contribution from leading plant biologists to elucidate several aspects of stress signaling by functional genomics approaches

Protein Interaction Networks in Health and Disease Spyros Petrakis, Miguel A. Andrade-Navarro, 2016-10-19 The identification and mapping of protein protein interactions PPIs is a major goal in systems biology Experimental data are currently produced in large scale using a variety of high throughput assays in yeast or mammalian systems Analysis of these data using computational tools leads to the construction of large protein interaction networks which help researchers identify novel protein functions However our current view of protein interaction networks is still limited and there is an active field of research trying to further develop this concept to include important processes the topology of interactions and their changes in real time the effects of competition for binding to the same protein region PPI variation due to alternative splicing or post translational modifications etc In particular a clinically relevant topic for development of the concept of protein interactions networks is the consideration of mutant isoforms which may be responsible for a pathological condition Mutations in proteins may result in loss of normal interactions and appearance of novel abnormal interactions that may affect a protein s function and biological cycle This Research Topic presents novel findings and recent achievements in the field of protein interaction networks with a focus on disease Authors describe methods for the identification and quantification of PPIs the annotation and analysis of networks considering PPIs and protein complexes formed by mutant proteins associated with pathological conditions or genetic diseases

Dendritic Cell and Macrophage Nomenclature and Classification Florent Ginhoux, Martin Williams, Shalin Naik, 2016-07-14 The mononuclear phagocyte system MPS comprises dendritic cells DCs monocytes and macrophages M s that together play crucial roles in tissue immunity and homeostasis but also contribute to a broad spectrum of pathologies They are thus attractive therapeutic targets for immune therapy However the distinction between DCs monocytes and M subpopulations has been a matter of controversy and the current nomenclature has been a confounding factor DCs are remarkably heterogeneous and consist of multiple subsets traditionally defined by their expression of various surface markers While markers are important to define various populations of the MPS they do not specifically define the intrinsic nature of a cell population and do not always segregate a bona fide cell type of relative homogeneity Markers are redundant or simply define distinct activation states within one subset rather than independent subpopulations One example are the steady state CD11b

DCs which are often not distinguished from monocytes monocyte derived cells and macrophages due to their overlapping phenotype Lastly monocyte fate during inflammation results in cells bearing the phenotypic and functional features of both DCs and M s significantly adding to the confusion In fact depending on the context of the study and the focus of the laboratory a monocyte derived cell will be either be called monocyte derived DCs or macrophages Because the names we give to cells are often associated with a functional connotation this is much more than simple semantics The name we give to a population fundamentally changes the perception of its biology and can impact on research design and interpretation Recent evidence in the ontogeny and transcriptional regulation of DCs and M s combined with the identification of DC and M specific markers has dramatically changed our understanding of their interrelationship in the steady state and inflammation In steady state DCs are constantly replaced by circulating blood precursors that arise from committed progenitors in the bone marrow Similarly some M populations are also constantly replaced by circulating blood monocytes However others tissue M s are derived from embryonic precursors are seeded before birth and maintain themselves in adults by self renewal In inflammation such differentiation pathways are fundamentally changed and unique monocyte derived inflammatory cells are generated Current DC monocyte and M nomenclature does not take into account these new developments and as a consequence is quite confusing We believe that the field is in need of a fresh view on this topic as well as an upfront debate on DC and M nomenclature Our aim is to bring expert junior and senior scientists to revisit this topic in light of these recent developments This Research Topic will cover all aspects of DC monocyte and M biology including development transcriptional regulation functional specializations in lymphoid and non lymphoid tissues and in both human and mouse models Given the central position of DCs monocytes and M s in tissue homeostasis immunity and disease this topic should be of interest to a large spectrum of the biomedical community

10th European Conference on Games Based Learning, Are We Pushing Animals to Their Biological Limits? Temple Grandin, Martin Whiting, 2018-07-31 Stimulating and thought-provoking, this important new text looks at the welfare problems and philosophical and ethical issues that are caused by changes made to an animal's telos, behaviour, and physiology, both positive and negative, to make them more productive or adapted for human uses. These changes may involve selective breeding for production appearance traits or competitive advantage in sport, transgenic animals, or the use of pharmaceuticals or hormones to enhance production or performance. Changes may impose duties to care for these animals further and more intensely, or they may make the animal more robust. The book considers a wide range of animals, including farm animals, companion animals, and laboratory animals. It reviews the ethics and welfare issues of animals that have been adapted for sport, as companions, in work, as ornaments, food sources, guarding, and a whole host of other human functions. This important new book sparks debate and is essential reading for all those involved in animal welfare and ethics, including veterinarians, animal scientists, animal welfare scientists, and ethologists.
