

Study Guide: Refraction & Lenses

I. Refraction

- **Definition:** Bending of light as it passes from one medium to another.
- **Causes:** Change in the speed of light due to the change in the medium's refractive index.
- **Snell's Law:**
 - $n_1 \sin(\theta_1) = n_2 \sin(\theta_2)$
 - n_1 : Refractive index of the first medium.
 - θ_1 : Angle of incidence.
 - n_2 : Refractive index of the second medium.
 - θ_2 : Angle of refraction.
- **Refractive Index (n):**
 - Ratio of the speed of light in a vacuum (c) to the speed of light in a medium (v): $n = c/v$.
 - Higher refractive index = slower speed of light in that medium.
 - Refractive index of vacuum = 1.
- **Critical Angle:**
 - The angle of incidence for which the angle of refraction is 90 degrees.
 - $\sin(\theta_c) = n_1/n_2$ (where $n_2 > n_1$).
- **Total Internal Reflection (TIR):**
 - Occurs when light travels from a higher refractive index medium to a lower refractive index medium at an angle of incidence greater than the critical angle.
 - Applications: Optical fibers, prisms, diamonds.

II. Lenses

- **Converging (Convex) Lenses:**
 - Thicker in the middle, thinner at the edges.
 - Converge light rays to a focal point.
 - Can form real or virtual images.
- **Diverging (Concave) Lenses:**
 - Thinner in the middle, thicker at the edges.
 - Diverge light rays.
 - Always form virtual, upright, and diminished images.
- **Focal Length (f):**
 - Distance from the lens to the focal point.
 - Positive for converging lenses, negative for diverging lenses.
- **Lens Formula:**
 - $1/f = 1/v + 1/u$
 - f : Focal length.
 - v : Image distance.
 - u : Object distance.

Refraction And Lenses Study Guide
