Evolutionary Genetics Charles W. Fox, Jason B. Wolf, 2006-04-27 Charles Fox and Jason Wolf have brought together leading researchers to produce a cutting edge primer introducing readers to the major concepts in modern evolutionary genetics This book spans the continuum of scale from studies of DNA sequence evolution through proteins and development to multivariate phenotypic evolution and the continuum of time from ancient events that lead to current species diversity to the rapid evolution seen over relatively short time scales in experimental evolution studies Chapters are accessible to an audience lacking extensive background in evolutionary genetics but also current and in depth enough to be of value to established researchers in evolution biology

Study Guide to Accompany Biology, Third Edition, by Arms & Camp Virginia Fry, 1987

Evolution through Genetic Exchange Michael L Arnold, 2006-07-27 Even before the publication of Darwin's Origin of Species the perception of evolutionary change has been a tree like pattern of diversification with divergent branches spreading further and further from the trunk In the only illustration of Darwin's treatise branches large and small never reconnect However it is now evident that this view does not adequately encompass the richness of evolutionary pattern and process Instead the evolution of species from microbes to mammals builds like a web that crosses and re crosses through genetic exchange even as it grows outward from a point of origin Some of the avenues for genetic exchange for example introgression through sexual recombination versus lateral gene transfer mediated by transposable elements are based on definably different molecular mechanisms However even such widely different genetic processes may result in similar effects on adaptations either new or transferred genome evolution population genetics and the evolutionary ecological trajectory of organisms For example the evolution of novel adaptations resulting from lateral gene transfer leading to the flea borne deadly causative agent of plague from a rarely fatal orally transmitted bacterial species is quite similar to the adaptations accrued from natural hybridization between annual sunflower species resulting in the formation of several new species Thus more and more data indicate that evolution has resulted in lineages consisting of mosaics of genes derived from different ancestors It is therefore becoming increasingly clear that the tree is an inadequate metaphor of evolutionary change In this book Arnold promotes the web of life metaphor as a more appropriate representation of evolutionary change in all lifeforms This research level text is suitable for senior undergraduate and graduate level students taking related courses in departments of genetics ecology and evolution It will also be of relevance and use to professional evolutionary biologists and systematists seeking a comprehensive and authoritative overview of this rapidly expanding field
