

Solutions to Chapter 5 Problems

5.1 Derive the transfer function $H(s) / Q(s)$ for the liquid-level system of Fig. P5.1 when

a) The tank level operates about the steady-state value of $h_s = 1$ ft

b) The tank level operates about the steady-state value of $h_s = 3$ ft.

The pump removes water at a constant rate of 10 cfm (cubic feet per minute); this rate is independent of head. The cross-sectional area of the tank is 1.0 ft^2 and the resistance R is 0.5 ft/cfm .

a) Volume balance : $q - 10 = A \frac{dh}{dt}$

The tank level operates about the steady state value of $h_s = 1$ ft (at this height the only outlet from the tank is through the pump)

at steady state : $q_s - 10 = 0$

after subtraction : $q - q_s = A \frac{dh}{dt}$

$$Q(s) = A \frac{dH}{dt}$$

Taking the transform : $Q(s) = AsH(s)$

Rearranging : $\boxed{\frac{H(s)}{Q(s)} = \frac{1}{As} = \frac{1}{s}}$

b) The tank level operates about the steady state value of $h_s = 3$ ft (at this height the outlets from the tank is through the pump and through the resistance)

Volume Balance : $q - 10 - \frac{(h - 2)}{R} = A \frac{dh}{dt}$

William Doney Chapter 5 Solutions:

Reflection and the Stability of Belief Louis E. Loeb, 2010 A unifying theme of Loeb's work is epistemological that Descartes and Hume advance theories of knowledge that rely on a substantial naturalistic component adopting one or another member of a cluster of psychological properties of beliefs as the goal of inquiry and the standard for assessing belief forming mechanisms Thus Loeb shows a surprising affinity between the epistemologies of the two figures surprising because they are often thought of as polar opposites in this respect Descartes and Hume are unique in that their philosophical texts are accessible beyond just a narrow audience in the history of philosophy their ideas continue to be a vital part of the field at large This volume will thus appeal to advanced students and scholars not just in the history of early modern philosophy but in epistemology and other core areas of the discipline

Weather Forecasting Eric P. Chassignet,Jacques Verron,2006-07-08 Progress in a wide range of ocean research and applications depends upon the prompt and dependable availability of ocean information products The field of physical oceanography has matured to a point where it is now conceivable to combine numerical models and observations via data assimilation in order to provide ocean prediction products on various spatial and time scales As a result many nations have begun large scale efforts to provide routine products to the oceanographic community The Global Ocean Data Assimilation Experiment GODAE provides a framework for these efforts i e a global system of observations communications modeling and assimilation that will deliver regular comprehensive information on the state of the oceans in a way that will promote and engender wide utility and availability of this resource for maximum benefit to the community The societal benefit will be an increased knowledge of the marine environment and ocean climate predictive skills for societal industrial and commercial benefit and tactical and strategic advantage as well as the provision of a comprehensive and integrated approach to the oceans We therefore considered it timely given the international context to bring together leading scientists to summarize our present knowledge in ocean modeling ocean observing systems and data assimilation to present an integrated view of oceanography and to introduce young scientists to the current state of the field and to a wide range of applications Ocean Biogeochemical Dynamics Jorge L. Sarmiento,2013-07-17 Ocean Biogeochemical Dynamics provides a broad theoretical framework upon which graduate students and upper level undergraduates can formulate an understanding of the processes that control the mean concentration and distribution of biologically utilized elements and compounds in the ocean Though it is written as a textbook it will also be of interest to more advanced scientists as a wide ranging synthesis of our present understanding of ocean biogeochemical processes The first two chapters of the book provide an introductory overview of biogeochemical and physical oceanography The next four chapters concentrate on processes at the air sea interface the production of organic matter in the upper ocean the remineralization of organic matter in the water column and the processing of organic matter in the sediments The focus of these chapters is on analyzing the cycles of organic carbon

oxygen and nutrients The next three chapters round out the authors coverage of ocean biogeochemical cycles with discussions of silica dissolved inorganic carbon and alkalinity and CaCO_3 The final chapter discusses applications of ocean biogeochemistry to our understanding of the role of the ocean carbon cycle in interannual to decadal variability paleoclimatology and the anthropogenic carbon budget The problem sets included at the end of each chapter encourage students to ask critical questions in this exciting new field While much of the approach is mathematical the math is at a level that should be accessible to students with a year or two of college level mathematics and or physics
