Reid, Alan R. Rosenfield, Alvin M. Sabroff, D. E. Strohecker, 1964 As part of the Metalworking Process and Equipment Program a survey was conducted to collect and summarize information on deformation characteristics of metals and their effect on processing operations This report presents information obtained from reports on Government sponsored work and from articles in technical publications The report covers eight subjects extrusion forging rolling thermal mechanical variables affecting the properties of refractory metals and alloys development of preferred orientations anisotropy of strength and ductility high strain rate deformation and strain aging In order to be useful to engineering students and production engineers the topics are treated in two ways Generalized discussions of common processes point out why specific variables must be modified in order to deform certain types of metals satisfactorily When practical data on the more difficult to form metals are used to illustrate the principles limitations and effects of the processes The objective is to help the non specialist recognize the implications of specific findings and to apply them to specific operations Author

Handbook on Rare Earth Metals and Alloys (Properties, Extraction, Preparation and Applications) NPCS Board of Consultants & Engineers, 2009-04-01

Rare earths are essential constituents of more than 100 mineral species and present in many more through substitution They have a marked geochemical affinity for calcium titanium niobium zirconium fluoride phosphate and carbonate ions Industrially important minerals which are utilized at present for rare earths production are essentially three namely monazite bastnasite and xenotime In modern time techniques for exploration of rare earths and yttrium minerals include geologic identification of environments of deposition and surface as well as airborne reconnaissance with magnetometric and radiometric equipment There are numerous applications of rare earths such as in glass making industry cracking catalysts electronic and optoelectronic devices medical technology nuclear technology agriculture plastic industry etc Lot of metals and alloys called rare earth are lying in the earth which required to be processed Some of the important elements extracted from rare earths are uranium lithium beryllium selenium platinum metals tantalum silicon molybdenum manganese chromium cadmium titanium tungsten zirconium etc There are different methods involved in production of metals and non metals from rare earths for example separation primary crushing secondary crushing wet grinding dry grinding etc The rare earths are silver silvery white or gray metals they have a high luster but tarnish readily in air have high electrical conductivity The rare earths share many common properties this makes them difficult to separate or even distinguish from each other There are very small differences in solubility and complex formation between the rare earths The rare earth metals naturally occur together in minerals Rare earths are found with non metals usually in the 3 oxidation state At present all the rare earth resources in India are in the form of placer monazite deposits which also carry other industrially important minerals like ilmenite rutile zircon sillimanite and garnet Some of the fundamentals of the book are commercially important rare earth minerals exploration for rare earth resources rare earth resources of the world some rare earth minerals and their approximate compositions rare earths in cracking catalysts rare earth based phosphors interdependence of applications and
