Water Everywhere!

Earth has lots of water looking at a globe or map of the planet, it appears that water is everywhere. Closer take up a huge fraction of the planet's surface. On land, enormous lakes appear in North America, Europe, and Asia. Mountains, rivers, seas, oceans, and small water cover large parts of Florida, Louisiana, Texas, and the Amazon. Hydrologists, scientists who study water, closely to understand why some places the ground is permanently saturated with water. Water comes to be in every part of the world... but why?

Look at the world map again. Examine the world's oceans. Look at the Arctic Ocean, the Atlantic Ocean, the Indian Ocean, and the Pacific. There are no lakes, no rivers, and no seas. If any, permanent streams. Hydrologists classify these areas as oceans. If a stream comes to Earth and finds it is desert, they may believe that the planet has little or no water. So why do some places, like the Amazon, have lots of water while others, like the Sahara, have very little?

Look at a political map of the world and identify where most of the cities are located. How many cities are in the Sahel Desert and central Australia? There is lots of land, so why do humans not build

more cities in those areas? The answer may seem obvious: there are no rivers, no lakes, no dry rivers in sight. Then, no, Riyadh in Saudi Arabia, Baghdad in Iraq, and Ulaanbaatar (Ulaanbaator) in Mongolia are all major cities in the middle of dry regions. Humans need water for their homes and crops for themselves. If there is no water, why would a settlement be established? Then, how could the settlement grow into a large city? What could explain this phenomenon?

Even in regions located near water, access to it is limited. The majority of cities on Earth, including what is located in deserts, is built on rivers, which is usually the humans and many plants and animals. It explains how much water and makes living things very rich. If not, water can even reach in depth. Dry conditions with specific adaptations can live in and conserve with water.

However, not all cities are built on rivers. Some cities are built on dry, arid, or desert. It is good water with no salt in channels. All cities and most know the desert contains salt water, so humans use them as water sources. So why is the ocean salty? Where does the salt come from?

Science Studies Weekly Exploration Answers:

Advances in Ocean Exploration Adam Soule, Daniel Wagner, Aurora Elmore, Leila J. Hamdan, 2024-09-20 The ocean covers more than 70% of the Earth's surface and encompasses 99% of its habitable volume yet is largely unexplored. However, new technologies, approaches, and a growing recognition of the ocean's role in sustaining the health, wealth, and security of modern society has spurred a rapid acceleration in ocean exploration and discovery. Past ocean exploration efforts have fundamentally impacted our view of the bounds of life on the planet, the human-ocean relationship, and the Earth's inner workings, and many more discoveries yet remain. The varied stakeholders for ocean exploration are exemplified in many of the UN Ocean Decade challenges that require generating baseline knowledge to expose ocean regions and processes not yet constrained. As more of the deep ocean is explored, we gain important insight into scientifically and societally relevant questions including the distribution of ocean organisms and ecosystems, seafloor mineralization, chemical cycling, and the role of the oceans in global climate. Ocean exploration benefits from deep integration across disciplinary boundaries and careful coordination between stakeholders and explorers. This volume brings together scientists, engineers, and educators across disciplinary boundaries towards the common goal of mapping and characterizing unknown parts of the ocean. To meet the tremendous challenge of exploring the world's oceans will require the incorporation of new technologies and approaches that enhance the efficiency of exploration, adopt the latest developments in autonomy, and recognize the value of ocean exploration for society's benefit. This current topic provides an overview of the latest data, results, and innovations along with an assessment of the current gaps in ocean exploration in order to focus the community's efforts and enhance the spread of current innovations. We invite contributions that describe advances in ocean exploration including but not limited to: Assessments of and novel approaches to identifying exploration gaps and targets; Descriptions of novel vehicle systems that utilize autonomy and artificial intelligence to enhance ocean exploration; Development of new sensors and samplers that offer opportunities for scaling up ocean exploration and minimizing impact to ocean environments; Approaches to accessing difficult-to-reach and challenging subsea environments for exploration; The synergies of combining uncrewed systems with human expertise; New methods for analyzing and interpreting ocean data that create new scientific outcomes and enhance data use; Approaches to engaging a more diverse ocean exploration community including the indigenous communities adjacent to ocean exploration targets; Evaluations of ocean exploration impact on issues of high societal relevance.

Exploring Climate Change through Science and in Society Mike Hulme, 2013-09-11 Mike Hulme has been studying climate change for over thirty years and is today one of the most distinctive and recognisable voices speaking internationally about climate change in the academy, in public, and in the media. The argument that he has made powerfully over the last few years is that climate change has to be understood as much as an idea situated in different cultural contexts as it is as a physical phenomenon to be studied through universal scientific practices. Climate change at its core embraces both science

and society both knowledge and culture Hulme's numerous academic and popular writings have explored what this perspective means for the different ways climate change is studied narrated argued over and acted upon Exploring Climate Change through Science and in Society gathers together for the first time a collection of his most popular prominent and controversial articles essays speeches interviews and reviews dating back to the late 1980s The 50 or so short items are grouped together in seven themes Science Researching Culture Policy Communicating Controversy Futures and within each theme are arranged chronologically to reveal changing ideas evidence and perspectives about climate change Each themed section is preceded with a brief introduction drawing out the main issues examined Three substantive unpublished new essays have been specially written for the book including one reflecting on the legacy of Climategate Taken as a collection these writings reveal the changes in scientific and public understandings of climate change since the late 1980s as refracted through the mind and expression of one leading academic and public commentator The collection shows the many different ways in which it is necessary to approach the idea of climate change to interpret and make sense of the divergent and discordant voices proclaiming it in the public sphere World Guide to Scientific Associations and Learned Societies
