

Modeling Photosynthesis and Cellular Respiration

Teacher Information

Summary

Students use simple snap beads to model the reactants and products of photosynthesis and cellular respiration. Optional review cards are provided to help students distinguish between photosynthesis and cellular respiration.

Core Concepts

- Photosynthesis, which occurs in chloroplasts, uses light energy to combine carbon dioxide and water into energy-rich organic molecules (such as glucose) and releases oxygen into the environment.
- Cellular respiration, which occurs in mitochondria, uses energy-rich organic molecules (such as glucose) and oxygen. It converts the energy from organic compounds into heat and the energy stored in ATP molecules. Carbon dioxide and water are released as waste products of cellular respiration.
- The energy stored in ATP is used to power an organism's life activities such as circulation, excretion, movement and synthesis.

- Carbon dioxide and water molecules used in photosynthesis are returned to the environment by the process of cellular respiration.
- Glucose and oxygen used in cellular respiration are produced by the process of photosynthesis.
