control of switching their responsiveness facilitated by evolutionarily conserved neuronal guidance genes. These genes which encode cues receptors or downstream signal transducers are essential not only for neural wiring but also for synaptic formation maintenance and remodeling as well as for organogenesis and homeostasis throughout life. Despite the limited classes of neuronal guidance genes our understanding of the underlying mechanisms remains incomplete. Recent discoveries such as the roles of microRNAs and exosomes suggest that we are on the cusp of a new wave of research. This research aims to uncover previously unknown mechanisms of neuronal guidance and how cells integrate multiple guidance signaling inputs including mechanical and adhesive signals to determine the behaviors of developing and mature neurons as well as non neural cells. Additionally there is a pressing need to understand how dysregulation of these pathways contributes to various human diseases including developmental neuropsychiatric and neurodegenerative disorders.
