

Instructions: After completing the Fermentation virtual lab and post-lab quiz in Connect, answer the following questions. Submit a PDF of your answers to the assignment in Canvas by 11:59pm on Thursday, April 23rd.

Questions:

1. The first step in the process of cellular respiration is glycolysis, in which glucose is converted to pyruvate, and NAD^+ is reduced to NADH . This process creates 2 net ATP. In order for glycolysis to continue repeatedly, NADH must be oxidized back to NAD^+ . (Note: You may want to review Figure 1 on p. 62 in the lab manual, shown below, and the Fermentation video in the Canvas module to answer the two questions below.)

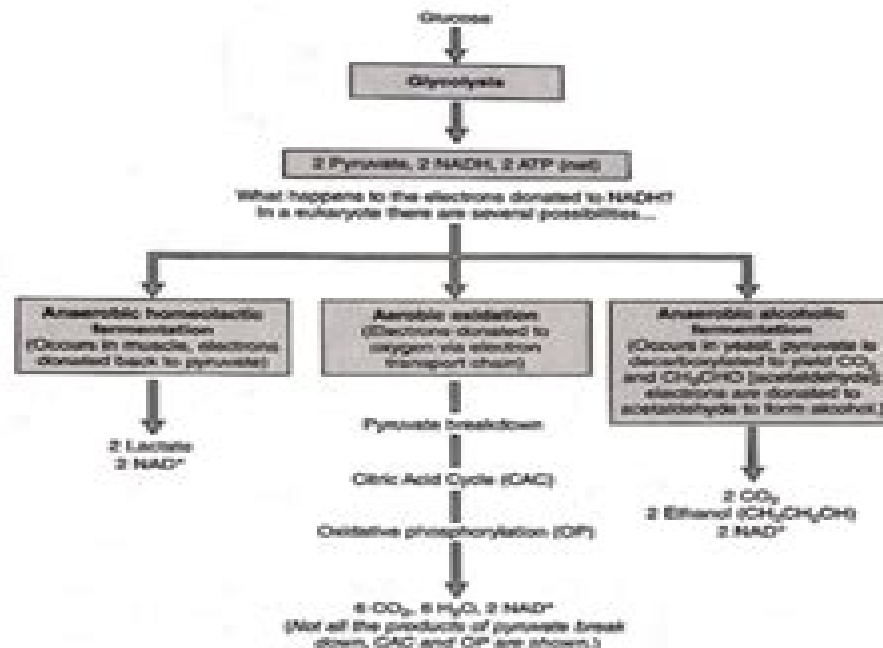

Figure 1. One of the products of glycolysis is NADH , which is rich in electrons. What happens to those electrons? In eukaryotes in the presence of oxygen, NADH donates its electrons to the electron transport chain in the inner membrane of the mitochondria. If oxygen is not present, then pyruvate remains in the cytosol. NADH then donates its electrons back to pyruvate. If this occurs in muscle the product is lactate ($\text{CH}_3\text{CH}(\text{OH})\text{COO}^-$); if this occurs in yeast the product is ethanol ($\text{CH}_3\text{CH}_2\text{OH}$).

- a. In the presence of oxygen, how is NADH oxidized back to NAD^+ ? (1 pt)
- b. Fermentation occurs in the absence of oxygen, so it cannot use the same process to regenerate NAD^+ . How does alcoholic fermentation solve the problem of converting NADH to NAD^+ so that glycolysis (and therefore ATP production) can continue? (1 pt)

Molecules, and Life Michael S. Matta,1981 Study Guide and Solutions Manual for Fundamentals of General, Organic, and Biological Chemistry Susan McMurry,1992 Interacting Stresses on Plants in a Changing Climate Michael B.

Jackson,Colin R. Black,2013-06-29 Books dealing with climatic change are commonplace as are those concerned with effects of environmental stresses on plants The present volume distinguishes itself from earlier publications by highlighting several interrelated environmental stresses that are changing in intensity as the climate warms in response to the accumulation of greenhouse gases The stresses examined at the NATO Advanced Research Workshop upon which this book is based include atmospheric pollutants flooding and sub mergence drought and cold In future successful farming or landscape management will ultimately depend on strategies that offset the effects of these and other environmental constraints while exploiting more favourable features However the to predicted speed of climate change may exceed the rate at which new approaches farming forestry landscape management and genetic conservation can be developed through experience and retroactive response The alternative is to anticipate future needs and thus identify appropriate management and legislative strategies by research and discussion The contents of this volume contribute to these vital processes upon which the productivity of agroecosystems and conservation of natural ecosystems may increasingly depend Those with any lingering doubts concerning the gravity of the likely future situation are especially encouraged to read the opening chapter For convenience chapters discussing pollution flooding drought and cold are grouped in separate sections However many authors have taken care to emphasise that interactions between the changing combinations of stresses pose particular problems for plants and plant communities
