

| Task | Explanation |
|-------------------------------------|---|
| Create a design | Prior to any configuration, a network diagram that illustrates the router interfaces should be created; this diagram should reflect both the LAN and wide area network (WAN) interfaces, as illustrated in Figure 7-5 |
| Use a meaningful router name | Because the name of the router appears in the command line during router configuration, it helps ensure that commands are given to the correct router; for example, if the name <i>Internet_Router</i> is assigned to the device, then the displayed command prompt would be <i>Internet_Router (config)#</i> |
| Secure all ports | All ports to the router should be secured; this includes both physical ports (sometimes called the console port and auxiliary port) and inbound ports from remote locations (sometimes known as VTY for virtual teletype) |
| Set a strong administrator password | Most routers allow a user to access the command line in user mode, yet an administrator password is required to move to privileged mode for issuing configuration commands |
| Make changes from the console | The configuration of the router should be performed from the console and not a remote location; this configuration can then be stored on a secure network drive as a backup and not on a laptop or USB flash drive |
