

STUDY GUIDE 4

DIFFRACTION, ELECTROMAGNETIC WAVES AND PARTICLE WAVES

This Study Guide introduces two processes involving the wave properties of light which are important in determining our ability to see distinctly: *light diffraction and light absorption*. (The latter topic continues in Study Guide 5.) The process of diffraction of light by the pupil of the eye is shown to be important in determining the resolution or resolving power of the visual system. In order to understand light absorption in the retina and elsewhere, this Study Guide discusses the wave-particle duality of electromagnetic radiation (waves and photons) and of particles such as electrons (particularly electrons in molecules). This material complements that of Study Guide 3 where the importance of refraction in visual systems is demonstrated.

OBJECTIVES:

By the end of the unit, the student should be able to:

1. Describe the relationship between diffraction and the Rayleigh Criterion for resolution as applied to the human eye.
2. Sketch diffraction-interference patterns from single and double slits and from a circular aperture; use equations such as $y_1 = \ell \lambda/a$ and $y_1 = \ell \lambda/2d$ to calculate features of these patterns (c.f. Expl. 4 and its associated quiz.)
3. Describe in a general way the dual (wave-photon) nature of electromagnetic radiation; use the equations $E = hf = hc/\lambda$ and $c = \lambda f$ in problems.
4. Discuss the wave nature of particles and use the equations $p = mv$, $K = \frac{1}{2}mv^2 = p^2/2m$ and $\lambda = h/p = h/\sqrt{2mK}$ in problems involving particle waves.
5. Determine and sketch wave functions and probability densities which describe π -electrons in linear chromophores.
6. Determine π -electron probability density and probability in specific regions of a biological chromophore such as retinal.
