Dimensional Analysis Across the Landscape of Physics Richard W. Robinett, 2025-04-23 Dimensional Analysis Across the Landscape of Physics introduces readers to the powerful idea that almost all physical quantities in science and engineering can be described using only five base dimensions mass length time charge and temperature and combinations thereof Starting with the basics of how this foundational intellectual concept arises it illustrates the use of dimensional analysis in approaching the solutions to textbook level problems in physics and adjacent fields ranging from introductory courses through the advanced undergraduate curriculum to advanced Physics electives It covers the core curricular topics of classical mechanics electricity and magnetism thermal physics and quantum mechanics It includes examples of the use of dimensional analysis applied to topics from other related fields such as geosciences meteorology engineering and biophysics to emphasize the utility of such methods across the proverbial landscape of physics There is also coverage of more specialized topics such as advanced quantum mechanics particle physics field theory condensed matter physics and astrophysics and gravitation Many worked examples are included as well as an extensive array of end of chapter problems with a solution manual available to instructors In addition to covering the standard topics in the undergraduate curriculum the book explores how dimensional analysis has been used and continues to be used in research across all fields of physics citing examples from the historical literature and from very recent research results The work includes extensive references to the original papers for further study as well as useful ancillary material including a dimensional analysis dictionary brief introductions to data fitting and connections to metrology There is an emphasis throughout on the use of modern symbolic programming to streamline the process of the solving systems of linear equations needed for a dimensional analysis approach with several Mathematica templates provided for reader use **Physics for Scientists and Engineers with Modern**

Explicit Barbara E. Lovitts,2023-07-03 Despite their and other stakeholders consistent demand for excellence doctoral programs have rarely if ever been assessed in terms of the quality of the dissertations departments produce Yet dissertations provide the most powerful objective measure of the success of a department s doctoral program Indeed assessment when done properly can help departments achieve excellence by providing insight into a program s strengths and weaknesses This book and the groundbreaking study on which it is based is about making explicit to doctoral students the tacit rules for the assessment of the final of all final educational products the dissertation The purpose of defining performance expectations is to make them more transparent to graduate students while they are in the researching and writing phases and thus to help

them achieve to higher levels of accomplishment Lovitts proposes the use of rubrics to clarify performance expectations not to rate dissertations or individual components of dissertations to provide a summary score but to facilitate formative assessment to support not substitute for the advising process She provides the results of a study in which over 270 faculty from ten major disciplines spanning the sciences social sciences and humanities were asked to make explicit their implicit standards or criteria for evaluating dissertations The book concludes with a summary of the practical and research implications for different stakeholders faculty departments universities disciplinary associations accrediting organizations and doctoral students themselves The methods described can easily be adapted for the formative assessment of capstone courses senior and master s theses comprehensive exams papers and journal articles Resources in Education ,1997
