

Newton's Second Law

Objectives

1. To verify experimentally the relationship between the force acting on an object, its mass, and its acceleration.

Introduction

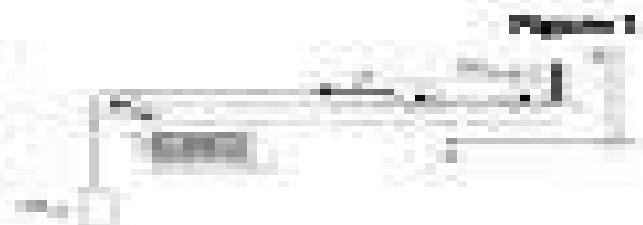

According to Newton's second law, the acceleration, a , of a body is directly proportional to the net force acting on the body, ΣF , applied to the body:

$$\Sigma F \propto a \quad \text{or} \quad ma \quad (1)$$

where m is the mass of the body.

The experimental setup for this experiment is shown in Figure 1 and is a variation of Atwood's machine.

A force F (tension) will be applied to directly to directly to the mass m_1 . The mass m_1 is connected to a spring with constant k and mass m_2 . It is connected to the ground through a pulley and through string. It is the difference between the two masses that will be measured.

$$\Sigma F_{m_1} = m_1 a \quad \text{or} \quad F \quad (2)$$

When F increases at the same rate as m_1 is increased while F is kept constant, the acceleration of the system is halved. Correspondingly, if F is doubled while m_1 is held constant, the acceleration of the system is doubled. This analysis assumes a frictionless pulley.

In addition, the magnitude of the force of a spring acting on the mass, the spring force, F , will be counterbalanced by the mass m_2 . The spring force and the weight of the mass m_2 are equal. The spring force is given by $F = kx$, where x is the displacement of the spring from its equilibrium position.

$$\Sigma F_{m_2} = m_2 a \quad \text{or} \quad F \quad (3)$$

In equilibrium, the spring force is equal to the weight of the mass m_2 . The spring force, F , is equal to the weight of the mass m_2 , $F = m_2 g$, where g is the acceleration due to gravity.

When F is increased, the mass m_2 will move up and the mass m_1 will move down. The acceleration of the system is given by $a = g$. When F is increased, the mass m_2 will move up and the mass m_1 will move down.

It is important to note that the

$$a = \frac{F}{m} \quad \text{or} \quad \frac{F}{m} = a$$
