Stan Brakhage Marco Lori, Esther Leslie, 2018 Essays on the work of this iconic experimental filmmaker from a variety of scholars Stan Brakhage's body of work counts as one of the most important within post war avant garde cinema and yet it has rarely been given the attention it deserves Over the years though diverse and original reflections have developed distancing his figure little by little from critical categories This collection of newly commissioned essays plus some important reprinted work queries some of the consensus on Brakhage's films In particular many of these essays revolve around the controversial issues of representation and perception This project sets out from the assumption that Brakhage's art is articulated primarily through opposing tensions which donate his figure and films an extraordinary depth even as they evince fleetingness elusivity and paradoxicality This collection aims not only to clarify aspects of Brakhage's art but also to show how his work is involved in a constant mediation between antinomies and opposites At the same time his art presents a multifaceted object endlessly posing new questions to the viewer for which no point of entry or perspective is preferred in respect to the others Acknowledging this this volume hopes that the experience of his films will be revitalized Featuring topics as diverse as the technical and semantic ambiguity of blacks the fissures in mimetic representation of the it within the itself of an image the film maker as practical psychologist through cognitive theories the critique of ocular centrism by mingling sight with other senses such as touch films that can actually philosophize in a Wittgensteinian way political guilt and collusion in aesthetic forms a disjunctive reflexive and phenomenological temporality realizing Deleuze's image time and the echoes of Ezra Pound and pneumophantasmology in the quest of art as spiritual revelation this book not only addresses scholars but also is a thorough and thought provoking introduction for the uninitiated Contributors include Nicky Hamlyn Peter Mudie Paul Taberham Gareth Evans Rebecca A Sheehan Christina Chalmers Stephen Mooney and Marco Lori

Conformal Field Theory for Particle Physicists Marc Gillioz,2023-04-13 This book is a set of introductory lecture notes on Conformal Field Theory CFT Unlike most existing reviews on the subject CFT is presented here from the perspective of a unitary quantum field theory in Minkowski space time The book starts with a non perturbative formulation of quantum field theory Wightman axioms and then gradually focuses on the implications of scale and special conformal symmetry all the way to the modern conformal bootstrap This approach includes topics such as subtleties of conformal transformations in Minkowski space time the construction of Wightman functions and time ordered correlators both in position and momentum space unitarity bounds derived from the spectral representation and the appearance of UV and IR divergences In each chapter the reader finds useful exercises to master the subject This book is meant for graduate students in theoretical physics and for more advanced researchers working in high energy physics who are not necessarily familiar with the concepts of conformal field theory Prior knowledge of quantum field theory is needed to master the arguments

Quantum Hamilton-Jacobi Formalism A. K. Kapoor,Prasanta K. Panigrahi,S. Sree Ranjani,2022-10-05 This book describes the Hamilton Jacobi formalism of quantum mechanics which allows computation of eigenvalues of quantum mechanical potential problems without solving for the wave function The examples presented include exotic potentials such as quasi exactly solvable models and Lamé and associated Lamé potentials A careful application of boundary conditions offers an insight into the nature of solutions of several potential models Advanced undergraduates having knowledge of complex variables and quantum mechanics will find this an interesting method to obtain the eigenvalues and eigen functions The discussion on complex zeros of the wave function gives intriguing new results which are relevant for advanced students and young researchers Moreover a few open problems in research are discussed as well which pose a challenge to the mathematically oriented readers

[An Algebraic Approach to the Many-Electron Problem](#) Jaroslav Zamastil,Tereza Uhlířová,2025-06-08 This book presents an algebraic approach to the coupled cluster method for many electron systems pioneered by Josef Paldus Using field methods along with an algebraic rather than diagrammatic approach facilitates a way of deriving the coupled cluster method which is readily understandable at the graduate level The book begins with the notion of the quantized electron field and shows how the N electron Hamiltonian can be expressed in its language This is followed by introduction of the Fermi vacuum and derivation of the

Hartree Fock equations along with conditions for stability of their solutions Following this groundwork the book discusses a method of configuration interaction to account for dynamical correlations between electrons pointing out the size extensivity problem and showing how this problem is solved with the coupled cluster approach This is followed by derivation of the coupled cluster equations in spin orbital form Finally the book explores practical aspects showing how one may take advantage of permutational and spin symmetries and how to solve coupled cluster equations illustrated by the Hubbard model of benzene the simplest quasi realistic model of electron correlation

Multi-time Wave Functions Matthias Lienert, Sören Petrat, Roderich Tumulka, 2020-10-30 The natural generalization of the quantum mechanical N particle wave function to relativistic space time is a function of N space time points and thus of N time variables This book based on a collection of lectures given at a spring school in Tbingen in 2019 provides an accessible and concise introduction to the recent development of the theory of multi time wave functions their use in quantum field theory their relation to detection probabilities and the mathematical question of consistency of their time evolution equations The book is intended for advanced students and researchers with an interest in relativity and quantum physics

Color in QCD Stéphane Peigné, 2024-05-13 This book introduces readers to the fascinating world of quantum chromodynamics QCD and quarks and gluons the elementary constituents of protons neutrons and all hadrons Specifically it focuses on the color of quarks and gluons responsible for their mutual interactions via the strong force The book provides an elementary introduction to the birdtrack technique which is a powerful tool for addressing the color structure of QCD in a pictorial way The technique shows how quark and gluon colors are combined and mixed in QCD The author discusses color conservation shows how to project on color states of systems of quarks antiquarks and gluons how to derive their color charges The book is enriched with many exercises integrated in the text to learn by doing This book is primarily intended for particle physics students graduates and researchers working in the field of QCD However it requires no specific prerequisites in QCD so it may also be of interest to students of mathematics as an illustration of the use of the birdtrack pictorial technique in representation theory

Introduction to the Theory of Incoherent Scattering of Radar Waves from Plasmas Hans László Pécseli, 2025-03-26 This book introduces the theory behind the incoherent scattering of electromagnetic waves radar waves by free electrons a key technique for studying critical parameters of the Earth's ionosphere Starting with scattering by statistically independent electrons including magnetized cases the book progressively develops a comprehensive model This framework is extended to include dressed particles accounting for long range Coulomb interactions between charged particles A consistent approach to incorporating particle collisions is presented with an example of charge exchange interactions for illustration Appendices provide essential background material ensuring the content is accessible to readers Based on lectures delivered at the University of Troms Norway this book is designed for Masters and PhD students It assumes a basic understanding of electromagnetism and plasma physics including plasma waves and electrostatic phenomena Familiarity with kinetic plasma

theory and the collisionless Vlasov equation is beneficial but not mandatory

Passive Optical Resonators for

Next-Generation Attosecond Metrology Ioachim Pupeza, 2022-02-01 This book introduces readers to the development of a new generation of high pulse repetition frequency instruments for multi dimensional attosecond resolution photoelectron spectroscopy attosecond PES It investigates the power scaling of femtosecond enhancement cavities for efficient intracavity high harmonics generation HHG Further it derives and verifies advanced resonator designs that feature large illuminated spots on all mirrors which mitigate both intensity and thermally induced enhancement limitations The dynamics of a high finesse passive resonator in the presence of a highly nonlinear optical process such as HHG are quantitatively investigated both theoretically and experimentally These investigations are instrumental in achieving the holistic optimization of the XUV source reported on here which for the first time reached intracavity HHG conversion efficiencies comparable to those achieved in single pass setups with a similar gas target Coupling out the XUV beam from the enhancement cavity by purely geometric means employing both the fundamental and higher order transverse Gaussian modes is studied This offers the advantages of robustness low distortion to the participating pulses and photon energy scalability Last but not least the author provides a range of proof of principle attosecond angle resolved PES experiments The book gives an outlook on the possible future development of cavity enhanced HHG and an extensive discussion on the generation of isolated XUV attosecond pulses via intracavity wavefront rotation
