

# Mirror plane, spherical, parabolic

- Mirrors alter the direction of light to create images, with different shapes serving distinct purposes
- Plane mirrors reflect light at equal angles, producing upright, virtual images of the same size as the object
- Spherical mirrors, divided into concave and convex types, focus or disperse light, affecting image size and type
- Parabolic mirrors, by directing all parallel incoming light rays to a single point, are used in applications requiring precise focus, such as telescopes and satellite dishes

## Practical example: Optics

- Mirrors, whether plane, spherical, or parabolic, are closely tied to the field of optics
- A plane mirror reflects light in a predictable way, offering a reflection with dimensions equal to the object
- Spherical mirrors, which include concave and convex types, manipulate light differently, focusing or dispersing rays to form images at various distances
- Parabolic mirrors focus parallel incoming light rays to a single point, optimizing light collection, which is essential in optical devices like telescopes and headlights
