Cell and Tissue Organization in the Circulatory and Ventilatory Systems Marc Thiriet, 2011-09-08 The volumes in this authoritative series present a multidisciplinary approach to modeling and simulation of flows in the cardiovascular and ventilatory systems especially multiscale modeling and coupled simulations The cardiovascular and respiratory systems are tightly coupled as their primary function is to supply oxygen to and remove carbon dioxide from the body's cells Because physiological conduits have deformable and reactive walls macroscopic flow behavior and prediction must be coupled to nano and microscopic events in a corrector scheme of regulated mechanisms Therefore investigation of flows of blood and air in physiological conduits requires an understanding of the biology chemistry

and physics of these systems together with the mathematical tools to describe their functioning The present volume is devoted to cellular events that allow adaptation to environmental conditions particularly mechanotransduction It begins with cell organization and a survey of cell types in the vasculature and respiratory tract It then addresses cell structure and functions especially in interactions with adjoining cells and matrix
