INTRODUCTION

SLINKY LAB

Waves occur all over the natural world. Light, sound, radiation, water ripples, etc. all occur as wave phenomena. There are two main types of waves that are found in the physical world: transverse waves, and longitudinal waves. Wave phenomena abide by the same rules regardless of the media it is transferred through - or in other words, there are not separate characteristics for light waves, or sound waves, or water ripples. Because of this we can investigate the characteristics of all waves using a coiled spring (slinky).

MEDIUM: the medium is the material that a wave is transmitted through. For example sound waves are transmitted through air, and water ripples are transmitted through water.

PART 1: TYPES OF WAVES

LONGITUDINAL WAVE: also known as a compression wave — a longitudinal wave is a wave in which the vibrational displacement occurs in the same direction as the motion of the wave.

Create a longitudinal wave pulse by creating a disturbance in a direction parallel to the direction of the wave motion. Describe what happens to the medium (slinky) as the pulse travels from one end to the other. (Hint: discuss energy and material)

TRANSVERSE WAVE: a transverse wave is a wave in which the vibrational displacement occurs in a direction perpendicular to the motion of a wave.

Generate a transverse wave pulse by moving your hand quickly to either the left or the right. Describe the motion of the medium as the pulse moves through it
