**Water Science for Food Health** Zeki Berk, 2001-08-17 Was held in Zichron Yaakov Israel on 16-21 September 2000. This book is the complete collection of the invited lectures presented at the Symposium. Research interest in the fundamental properties of water and water-mediated phenomena has generated a wealth of new knowledge and novel technological applications in widely diverse areas: food science, agriculture, microbial and plant physiology, and metabolism, human health, environment. The title of the Symposium, Water Science for Food Health, Agriculture and Environment, was defined so as to reflect this diversity. True to the tradition set by previous ISOPOW meetings, ISOPOW 2000 was planned according to the Gordon Conference concept. About 110 participants, not including accompanying guests and students from 21 different countries, attended the Symposium. The scientific programme consisted of 22 invited lectures, 60 poster presentations, and two sessions of expert panel discussions with audience participation. Two additional sessions were devoted to the oral presentation and discussion of selected posters. Sufficient time for discussion was allocated at each session and between sessions, and this was utilized well by the participants. The scientific level of the program met with extreme participant satisfaction. One of the most significant events of the Symposium was the panel discussion session entitled 'Critical Issues Related to Water Activity'. The original views and ideas expressed at this session and the heated discussion around controversial issues and open questions should lead to the following conclusion: Water Science will continue to generate new material of utmost importance and high scientific quality for many more ISOPOW meetings to come.

**Properties of Water from Numerical and Experimental Perspectives** Fausto Martelli, 2022-10-20. As the most important liquid in our life and one of the most abundant molecules in the universe, water is the least understood substance, with a very rich phase diagram: at least 18 crystalline forms and two liquids, and more than 60 dynamical thermodynamic anomalies whose origins are still under debate. *Properties of Water from Numerical and Experimental Perspectives* gathers together leading scientists and experts in the field of water. By merging the theoretical/computational point of view with experimental approaches, it presents a state-of-the-art description of the properties of water, enlightening the source of the anomalies of water and describing how such anomalies actively affect the functioning of biological substances.
