Variation and Correlation in the Crayfish Raymond Pearl, 2016-06-22 Excerpt from Variation and Correlation in the Crayfish With Special Reference to the Influence of Differentiation and Homology of Parts Naturally the data collected to answer these questions threw light on other problems of variation which will be considered further on in the paper Both of the main problems we had before us have been incidentally considered in several cases by earlier workers but so far as we are able to learn no systematic investigation aimed at their elucidation and working by quantitative methods on a considerable number of characters of an organism has ever been made It seemed desirable that such an investigation should be undertaken About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books Find more at www.forgottenbooks.com This book is a reproduction of an important historical work Forgotten Books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy In rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition We do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works **Effects of Omnivorous Crayfish on Fish Populations and the Structure of Littoral Communities** Nathan Jeffrey Dorn, 2003

The Fine Structure of the Arthrobranch of the Crayfish, Pacifastacus Leniusculus Dana, with Special Reference to Active Ion Uptake Howard Curtis Morse, 1967 The gills of an Oregon crayfish *Pacifastacus leniusculus* Dana were examined with histological and histochemical techniques and their fine structure was investigated by electron microscopy Special attention was given to the structural basis of active ion uptake The histology of these gills was the same as that of other crayfish species described by earlier workers There are basically three cell types hypodermal cells of stalk and tubules connective tissue cells and nephrocytes In addition two cell products are present the cuticle and connective tissue fibers The hypodermal cells of the stalk combine into a solid sheet underlying the cuticle while those of the tubules are pear shaped with a body neck and cytoplasmic sheet The body containing the nucleus continues into a smaller neck which flares out into the flattened sheet running perpendicular to the length of the neck but parallel to and closely apposed to the cuticle Nephrocytes are large multinucleate phagocytes attached to the walls of efferent vessels of the stalk and tubules as well as the stalk mantle canal These cells are found to contain much acid phosphatase activity Electron

microscopy reveals that the nephrocytes are covered on the surface with a system of long microvilli which drape over cisternae. The plasma membrane delimits the inner surface of the cisternae on which numerous micropinocytotic vesicles can be seen in favorable sections. Within the cytoplasm are dense bodies, vesicles resembling micropinocytotic vesicles, peripheral vacuoles and large central vacuoles. Dictyosomes and large mitochondria with few cristae and of low electron density are occasionally seen. It is suggested that material which is phagocytized by micropinocytosis may be combined with dense bodies which may contain lytic enzymes to form peripheral and thence central vacuoles where intracellular digestion would occur. The surface position of the hypodermal cells of the stalk or tubules makes them both likely candidates for a role in active ion uptake. The apparent lesser density of the tubule cuticle and greater abundance of mitochondria in the pear shaped hypodermal cells of the tubules compared with the stalk cuticle and hypodermis indicates that the pear shaped cells are more likely involved in such a process. Chloride localization with silver salts at the organ level indicates that the cuticle of tubules arising from the base and midsection of a gill stalk are strikingly more ion permeable than tubules from the tip of the stalk or other parts of the whole body surface. This permeability difference correlates with a fine structure difference in tubular cuticle and pear shaped cells depending upon their location. The cytoplasmic sheet of pear shaped cells from the gill tip is thinner and may contain fewer mitochondria while the cuticle in this region has an epicuticle of higher electron density. Chloride localization with silver acetate at the fine structure level somewhat suggests the same base to tip differentiation and shows localization of the precipitated silver at the outer membrane of pear shaped cells and cytoplasmic sheet. This suggests that the chloride pump is located in the outer membrane of the pear shaped cells and cytoplasmic sheet located in the tubules of the lower half of the gills.
