#### **Cognitive/Epistemological and Spiritual Development**

Cognitive structural theories describe the process of epistemological and intellectual development during the college years (Patton, et al., 2016). Rooted in the work of Piaget, these theories focus on how people think, reason, and make meaning of their experience (Patton, et al., 2016). Spiritual development is theoretically understood as object relations maturity and contemplative spiritual awareness (Hall, 2004, 2007). Social science literature includes studies of cognitive/moral development as measured by the Commons Model of Hierarchical Complexity and of spiritual/religious development as measured by the Spiritual Assessment Inventory (Hall & Edwards, 1996, 2002), but not of the association between them. Epistemology is an area of philosophy concerned with the nature and justification of human knowledge.

A growing area of interest for psychologists and educators is that of personal epistemological development and epistemological beliefs: how individuals come to know, the theories and beliefs they hold about knowing, and the manner in which such epistemological premises a part are of and an influence on the cognitive processes of thinking and reasoning. Perry (1970) was the first to suggest that how college students made meaning of their educational experiences was not a reflection of personality but an evolving developmental process. He provided an interactionist model for interpreting students' epistemological responses to the college environment. A central contribution of the scheme has been the articulation of the dualistic, multiplicity, and relativistic points of view that characterize the epistemological outlook of many college students. Faith is differentiated from cognitive development theories because it is the activity of seeking and composing meaning from human experience. That is, faith is trying to make sense of the "big picture," trying to find an overall sense of meaning and purpose in one's life. Parks (2000) described spirituality to be a personal search for meaning, transcendence, wholeness and/or purpose. Therefore from this perspective, spirituality is at the core of religion.

#### **Moral Development**

College Administrators have expressed concerns about the moral developments of college students since the beginning of higher education, when college presidents were responsible for the moral character of the young men in their care (Thelin, 2011). Though colonial educators attached religious beliefs to morality, contemporary educators and researchers understand that morality and religion are separate constructs. Moral development in college students describes the processes through which individuals develop more complex principles and ways of reasoning about what is right, just and caring (Patton, et al., 2016). As we grow, we pass through distinct stages of moral development in which our ethical thinking is based on different principles.

**NETWORKS. EXAMPLES WITH MATLAB** Cesar Perez Lopez, MATLAB has the tool Deep Learning Toolbox that provides algorithms functions and apps to create train visualize and simulate neural networks You can perform classification regression clustering dimensionality reduction timeseries forecasting and dynamic system modeling and control Dynamic neural networks are good at timeseries prediction You can use the Neural Net Time Series app to solve different kinds of time series problems It is generally best to start with the GUI and then to use the GUI to automatically generate command line scripts Before using either method the first step is to define the problem by selecting a data set Each GUI has access to many sample data sets that you can use to experiment with the toolbox If you have a specific problem that you want to solve you can load your own data into the workspace With MATLAB is possible to solve three different kinds of time series problems In the first type of time series problem you would like to predict future values of a time series  $y_t$  from past values of that time series and past values of a second time series  $x_t$  This form of prediction is called nonlinear autoregressive network with exogenous external input or NARX In the second type of time series problem there is only one series involved The future values of a time series  $y_t$  are predicted only from past values of that series This form of prediction is called nonlinear autoregressive or NAR The third time series problem is similar to the first type in that two series are involved an input series predictors  $x_t$  and an output series responses  $y_t$  Here you want to predict values of  $y_t$  from previous values of  $x_t$  but without knowledge of previous values of  $y_t$  This book develops methods for time series forecasting using neural networks across MATLAB Applied Mechanics Reviews, 1974 Real World Applications of Computational Intelligence Mircea Gh.
