Saini, Dr. Sunita Saini, Dr. Ram Paul, Dr. Akanksha Aggarwal, 2024-03-07 It is unfortunate that the rapid growth of the economy has resulted in problems such as pollution traffic congestion and energy shortages all of which have contributed to a decline in the quality of life of the general population As a result of its low emissions energy consumption and pollution levels new energy cars have caught the attention of numerous national governments throughout the globe In China these vehicles have reached a national strategic level Every year China s dependency on crude oil that is imported from other countries increases

According to the National Energy Administration China's dependency on imported crude oil reached 73% in the year 2020. This has a major effect on energy security since it is higher than the universally accepted threshold of 50% for energy security. Considering that China is experiencing a shortage of energy, the country puts a high strategic significance on the research and development of vehicles that utilize new energy. A public statement of China's national objectives has been made in recent years. These targets include attaining carbon neutrality in the year 2060 and reaching a carbon peak in the year 2030. In terms of the long-term sustainability of the automotive industry, new energy vehicles are the connecting element that holds everything together. In order to address the energy and environmental issues, the development of alternative energy vehicles is a potential answer. To restate, China will not be able to achieve its goal of being carbon neutral unless it makes significant investments in alternative fuel vehicles. This is due to the fact that there is no amount of hype about a new energy revolution. The term new energy vehicle refers to a vehicle that incorporates the most recent advancements in power control and drive technology with the established technology that is present in traditional cars. The power generation process is accomplished by the utilisation of unconventional vehicle fuel or a mix of conventional vehicle gasoline and an on-board power plant.

An Introduction to the Green Economy Adrian C. Newton, Elena Cantarello, 2014-08-13 The green economy is widely seen as a potential solution to current global economic and environmental crises and a potential mechanism by which sustainable development might be achieved in practice Considerable investments are now being made into the development of green technology renewable energy biodiversity conservation resource efficiency recycling of materials and green infrastructure This textbook provides a comprehensive introduction to the green economy using a strongly interdisciplinary approach based on environmental science rather than treating it as a sub set of economics The scientific principles of sustainability are presented which provide the foundations of the green economy with a particular focus on systems based approaches

Examples of real world case studies are used to illustrate how the green economy can be achieved in practice In this way the authors provide a thorough overview of both the principles and practice of the green economy drawing from a wide range of disciplines including ecology geography social science psychology sustainability science environmental science law and economics The emphasis is on presenting results of the latest research derived from leading scientific journals Rather than focusing on a single definition of what constitutes a green economy the book introduces readers to the diversity of opinion that exists and engages them in what is an active on going debate This reflects the fact that many aspects of the green economy and sustainable development more generally are currently contested In particular the book will help readers to strengthen their ability to critically evaluate the evidence for and against the views presented and to actively contribute to the future development of the green economy
