## Levels of Organization in Multicellular Organisms

Multicellular organisms, both plants and animals are composed of several levels of organization. These levels range from the smallest building block of life to complex structures that are organized to maintain each tissue in their environment.

To better understand the levels within an organism, the scientist uses the following levels of organization. They are: cells, tissues, organs, organ systems, and organism.

A tissue is a group of similar cells that work together to perform a specific function. Tissues are found in all multicellular organisms. The simplest example of a tissue is muscle tissue, which is made up of muscle cells.

An organ is a group of tissues that work together to perform a specific function. Organs are found in all multicellular organisms. The simplest example of an organ is the heart, which pumps blood throughout the body.

An organ system is a group of organs that work together to perform a specific function. Organ systems are found in all multicellular organisms. The simplest example of an organ system is the digestive system, which breaks down food into nutrients.

An organism is the complete, fully functioning individual of the highest level of organization. It is the result of all the levels of organization working together. Each organism has specific adaptations that allow it to survive and thrive in its environment.

**The Origin and Early Evolution of Life** Tom Fenchel, 2002 Origin and Early Evolution of Life draws on evidence from molecular genetics the structure and function of extant organisms and geology It covers the period from about 4 billion years ago when life is thought to have originated to about 600 million years ago when multicellular organisms first arose There are significant gaps in our understanding of the earliest evolution of life forms but an insight into the topic leads to a more profound understanding of life itself Particular emphasis is placed on the fact that although life arose very soon after the origin of the Earth it was represented only by simple microbial life forms for approximately 85% of this time Increase in complexity beyond the microbial level took place only very late in the history of life

*Consilience, Truth and the Mind of God* Richard J. Di Rocco, 2018-12-17. This book argues that God can be found within the edifice of the scientific understanding of physics, cosmology, biology, and philosophy. It is a rewarding read that asks the Big Questions which humans have pondered since the dawn of the modern human mind, including: Why and how does the universe exist? From where do the laws of physics come? How did life and mind arise from inanimate matter on Earth? Science and religion have a common interest in the answers to such questions, yet many scientists and believers have been at odds for centuries. The author and contributors present a program for moving beyond the vastly different perspectives of reality offered by science and religion. Historical proofs for the existence of God are considered in light of the possibility that the universe may be only one in an eternal multiverse that contains an infinite number of other universes. Readers will find a modification of St. Augustine's Argument from Truth for the existence of the necessary self-sufficient being, commonly referred to as God. This book is suited to all with an interest in the crossing points of science and religion, providing much food for thought and reflection. If in the end you cannot accede to philosophy's proofs or theism's invitation to faith, perhaps you will nevertheless say yes to the amazing universe in which we live.
