

The Spread of Pathogens

18/10

Communicable diseases are spread between individuals by direct contact, indirectly, but always via a reservoir for pathogens, whether the reservoir is a host or an inanimate object. Pathogens are pathogens, and the more the reservoir they come to spread the more

Model 1 - The 1854 London

Emerging and Endemic Pathogens Kevin P. O'Connell, Evan W. Skowronski, Lela Bakanidze, Alexander Sulakvelidze, 2010-08-25 It is a truism among biologists that an organism's phenotype is the product of both its genotype and its environment An organism's genotype contains the total informational potential of the individual while its environment shapes the expression of the genotype influences the rate of mutation and occurrence of modifications

and ultimately determines the likelihood that the genotype or fractions thereof will survive into the next generation In the relationship between host and pathogen therefore each forms a part of the environment of the other mutually influencing the biology of both partners on scales ranging from the life history of individuals to the fate of populations or entire species Molecular biologists working on problems in pathogenesis generally think of the host organism as the pathogen s environment and perhaps occasionally consider the pathogen as part of the host s environment However because environment can be defined at many scales so too can phenotypes if a pathogen as a species is considered to exist in a host as a species then among its phenotypes is the nature of the pandemic disease it can cause within the host community The contributors to the proceedings of this NATO Advanced Research Workshop have treated the interplay of environment and genotype in the host pathogen relationship and its relationship to the problem of emerging infectious disease at both the macroscopic and microscopic molecular levels along this continuum of scale with some human history thrown in at times for good measure
