Burgess, Brent L. Nielsen, 2016-12-12 One of the distinguishing features of plants is the presence of membrane bound organelles called plastids Starting from proplastids undifferentiated plastids they readily develop into specialised types which are involved in a range of cellular functions such as photosynthesis nitrogen assimilation biosynthesis of sucrose starch chlorophyll carotenoids fatty acids amino acids and secondary metabolites as well as a number of metabolic reactions like sulphur metabolism The central role of plastids in many aspects of plant cell biology means an in depth understanding is key for a holistic view of plant physiology Despite the vast amount of research the molecular details of many aspects of plastid biology remains limited Plastids possess their own high copy number genome known as the plastome Manipulation of the plastid genome has been developed as an alternative way to developing transgenic plants for various biotechnological applications High copy number of the plastome site specific integration of transgenes through homologous recombination and potential to express proteins at high levels 70% of total soluble proteins has been reported in some cases are some of the technologies being developed Additionally plastids are inherited maternally providing a natural gene containment system and do not follow Mendelian laws of inheritance allowing each individual member of the progeny of a transplastomic line to uniformly express transgene's Both algal and higher plant chloroplast transformation has been demonstrated and with the ability to be propagated either in bioreactors or in the field

both systems are well suited for scale up of production The manipulation of chloroplast genes is also essential for many approaches that attempt to increase biomass accumulation or re routing metabolic pathways for biofortification food and fuel production This includes metabolic engineering for lipid production adapting the light harvesting apparatus to improve solar conversion efficiencies and engineering means of suppressing photorespiration in crop species which range from the introduction of artificial carbon concentrating mechanisms or those pre existing elsewhere in nature to bypassing ribulose biphosphate carboxylase oxygenase entirely The purpose of this eBook is to provide a compilation of the latest research on various aspects of plastid biology including basic biology biopharming metabolic engineering bio fortification stress physiology and biofuel production

Effects of Drought on Forests and Rangelands in the United States James M. Vose,James Samuel Clark,Charles Henry Luce,Toral Patel-Weynand,2016 This assessment provides input to the reauthorized National Integrated Drought Information System NIDIS and the National Climate Assessment NCA and it establishes the scientific foundation needed to manage for drought resilience and adaptation Focal areas include drought characterization drought impacts on forest processes and disturbances such as insect outbreaks and wildfire and consequences for forest and rangeland values Drought can be a severe natural disaster with substantial social and economic consequences Drought becomes most obvious when large scale changes are observed however even moderate drought can have long lasting impacts on the structure and function of forests and rangelands without these obvious large scale changes Large stand level impacts of drought are already underway in the West but all U S forests are vulnerable to drought Drought associated forest disturbances are expected to increase with climatic change Management actions can either mitigate or exacerbate the effects of drought A first principal for increasing resilience and adaptation is to avoid management actions that exacerbate the effects of current or future drought Options to mitigate drought include altering structural or functional components of vegetation minimizing drought mediated disturbance such as wildfire or insect
