

TOYOTA POSITIVE CRANKCASE VENTILATION SYSTEM

The Positive Crankcase Ventilation System prevents blow-by gas from being released into the atmosphere and thus causing air pollution. Blow-by gas from the crankcase is returned to the intake manifold and air cleaner to be reburned in the combustion chambers. For better performance and longer engine life, periodic inspection and servicing of this system are required. The ventilation valve should be replaced every 12,000 miles or after 12 months. The rubber hoses and fittings should also be inspected regularly and cleaned or replaced if necessary. If the engine idling speed becomes too slow or irregular, the ventilation valve may be seized or clogged. Then the ventilation valve should be checked before adjusting the carburetor to compensate irregularities.

TOYOTA CASE STORAGE SYSTEM

Hi-Lux for the state regulating the fuel vapor control, is equipped with Toyota Case Storage System. This system prevents fuel vapor emission by storing the fuel vapor in the storage case and leading it to the intake manifold together with fresh air drawn in from the air filter, and consists of a purge control valve, a fuel vapor storage case, an air filter, a thermal expansion tank and a modified fuel tank. The air filter must be cleaned regularly.
