ABSTRACT

Three groups of novice pilots received training to fly aerobatic maneuvers in a light aircraft. Trainees in the control group received in-flight instruction and were given the usual briefings before each flight. Trainees in the two experimental groups received extra training: each in-flight lesson was preceded by PC-based simulated flight. A total of 2053 maneuvers were analyzed on the basis of both flight-data recordings and instructor ratings. We hypothesized that complex manual flying skills, learned on the ground, transfer to the aircraft. The results provide no objective support for this hypothesis. There were no significant differences in flying skills between the three groups as measured by the flight-data recordings. However, both experimental (PC-) groups managed to fly significantly more maneuvers in the same amount of flight time in the aircraft. Differences between flight-data recordings and instructor ratings are analyzed in detail. In the discussion, we compare the findings with published transfer-experiments with PC-based simulation.

1.0 INTRODUCTION

1.1 Low-Fidelity Training In Flight Instruction

Traditionally, the design of flight simulators for pilot training has been based on the assumption that the more a simulator behaves, responds, feels and looks like a real aircraft, the better will be the training. This is what we call the 'high-fidelity view of flight simulation'. However, this view has changed somewhat over the last few decades. Positive transfer to the actual in-flight environment has been demonstrated with low-fidelity PC-based simulation training in a number of experimental transfer studies ([1], [2], [3], [4], [5], [6], [7], [8], [9], [10]) that focus on the initial stage of flight training. All these studies demonstrated positive transfer for standard flying tasks, such as basic instrument tasks, visual landings, visual turns, etc. in the initial stage of flight training.

1.2 Moving Away From Fidelity

Intentional deviations from fidelity may even contribute positively to transfer, as was demonstrated by [8]. This evidence is supported by other transfer experiments that fall outside the PC-based category. An example is transfer to landing skills under crosswind conditions, which was higher after training without crosswind than after training with crosswind [11]. A number of experiments with 'augmenting' visual objects (such as

This dissertation explores the topic of human automation teamwork in Air Traffic Control ATC. ATC is a high stakes environment where complex automation is being introduced while the human operator has the legal responsibility. With increasing demands on productivity in various industries as also in ATC automation is introduced for efficiency maintaining safety and to keep the workload of the human operator within acceptable limits. However previous research has shown that automation may cause negative effects on the human operator and performance such as forcing the operator out of the control loop which might lead to problems or confusion. Previous research suggests a need for strengthening human automation collaboration where automation is seen as a team member to keep the operator in the loop. In order to achieve such teamwork the design of the automation needs to be human centred i.e. that the automation is designed for the underlying need of the operator. The aim of this dissertation is to explore teamwork in ATC from several angles to understand how the air traffic controllers are working in current ATC environments and how automation could be designed to support human automation teamwork. The included studies rely on interviews, simulations and questionnaires all with operational air traffic controllers as participants. The results indicate that for both human human teamwork and human automation teamwork teamwork factors such as adaptability and mutual performance monitoring knowing what the other team members are doing are important for the work performance in current ATC environments where mutual performance monitoring is especially important during stressful situations. When designing automation lessons learned from human human teamwork should be considered. The work within the scope of this dissertation identifies and concerns two human automation teamwork aspects: boundary awareness and implicit communication. These are proposed to support the operator's knowledge about the automation and the communication flow between the operator and the automation. Boundary awareness is the operator's knowledge of the automation's abilities, its boundaries, what it can or cannot manage and about consequences if it would go outside of these boundaries. Implicit communication is the unspoken or implied small cues that the operator and the automation can use to communicate with each other. It is proposed that implicit communication can be based on the work patterns of the operator. The knowledge gained through the work in this dissertation can be used as a foundation for further research and design of automation regarding operator knowledge about the automation boundaries and the communication within the team. Denna avhandling utforskar teamwork mellan människor och automation inom flygtrafikledning. Flygtrafikledning är en högt riskfylld miljö där komplex automation introduceras samtidigt som den mänskliga operatören har det juridiska ansvaret. Med ökade krav på produktivitet inom olika industrier och även inom flygtrafikledning introduceras automation för effektiviteten för att bibehålla säkerheten och för att hålla arbetsbelastningen för den mänskliga operatören inom acceptabla gränser. Tidigare forskning har dock visat att automationen kan orsaka negativa effekter på den mänskliga operatören.
