High Peaks Engineering L.D. Cross, 2014 Building transportation routes through the Rockies is dangerous It always has been It is also expensive labour intensive and highly political But railway and highway construction through the western cordillera succeeded thanks to scientific innovation and sheer human grit In the nineteenth century steam locomotives railways tunnels trestles and telegraphy represented the hi tech advances of the day A vast country with a small population raised money and more and more money and overcame mountain summits foul weather and scandal to build the longest railway of its time that would unify the young nation of Canada from east to west To offset operating costs and increase passenger traffic the three architectural wonders of the Banff Jasper and Lake Louise Resorts were created amid snowy heights glaciers and the headwaters of four river systems Athabasca Columbia Fraser and the North Saskatchewan Natural marvels like Cave and Basin Radium Miette and other mineral hot springs were also developed In the twentieth century the construction of the Trans Canada Highway accelerated the appeal of the peaks Today oil and gas pipelines are pushing new routes through the Rocky Mountains The physical challenges are similar to earlier eras but high peaks engineering must also address the ecological impacts of pipeline corridors moving oil and gas through Rocky Mountain passages It will be another test of Canadian resourcefulness
