Problems 1 and 2 together illustrate that the graph of an "offspring" function of the parent cubic function $y = x^3$ has only one x-intercept.

The graph of the cubic function $y = x^3 - 2x^2 - 5x + 6$ has three x-intercepts. You cannot obtain this function or others like it by transforming the parent cubic function $y = x^3$ using stretches, reflections, and translations.

Similarly, some quartic functions are simple transformations of $y = x^4$ and some are not.
