

impedance here also requires the tuned circuit to be tapped. This autotransformer configuration not only matches impedances but also reduces the loading on the L-C circuit, thereby increasing the Q and making it easier for the circuit to oscillate. The terminals of these miniature components

(Fig. 427) are designed for easy insertion into printed-circuit boards — no other means of securing these lightweighters are needed.

Converter stages have one other important inductor that forms a tuned circuit. Wound on a ferrite core to increase the Q (which is very important in all tuned circuits) it may assume a variety of shapes. Two of the most popular forms are shown in Fig. 425. Connections are similar to those indicated in Fig. 409. This coil, with the help of a section of a variable capacitor gang, selects the stations to be received. A side view of a coil (similar to that in Fig. 425-B) is shown

mounted in a two-transistor reflex receiver (Fig. 424).

A reflex circuit is one in which the amplifying element of one stage amplifies at two widely separated frequencies. In this case, one transistor is an rf amplifier feeding a diode detector, transformer-coupled by T . The detected signal is then fed back to V as an audio frequency and again amplified before being fed to the output stage. These receivers are quite inexpensive. Strong local stations are received at a comfortable loud-speaker listening level. Some stations are heard in separate from others due to the lack of sufficient tuned circuits, as found in superheterodyne sets. No servicing can be spent on the repair of this circuit. Many receivers of this type sell for under \$10, and the cost of repairs other than batteries may equal or exceed the original purchase price.
