Model-Based Control of Particulate Processes Panagiotis D. Christofides, 2013-04-17 Particulate processes are characterized by the co presence of a continuous phase and a dispersed particulate phase and are widely used in industry for the manufacturing of many high value products Examples include the crystallization of proteins for pharmaceutical applications the emulsion polymerization reactors for the production of latex the aerosol synthesis of titania powder used in the production of white pigments and the thermal spray processing of nanostructured coatings It is now well understood that the physico chemical and mechanical properties of materials made with particulates depend heavily on the characteristics of the corresponding particle size distribution This fact together with recent advances in dynamics of infinite dimensional systems and nonlinear control theory has motivated extensive research on model based control of particulate processes using population balances to achieve tight control of particle size distributions This book the first of its kind presents general methods for the synthesis of nonlinear robust and constrained feedback controllers for broad classes of particulate process models and illustrates their applications to industrially important crystallization aerosol and thermal spray processes The controllers use a finite number of measurement sensors and control actuators to achieve stabilization of the closed loop system output tracking attenuation of the effect of model uncertainty and handling of actuator saturation

Bioprocess Engineering Principles Pauline M. Doran, 1995-04-03 The emergence and refinement of techniques in molecular biology has changed our perceptions of medicine agriculture and environmental management Scientific breakthroughs in gene expression protein engineering and cell fusion are being translated by a strengthening biotechnology industry into revolutionary new products and services Many a student has been enticed by the promise of biotechnology and the excitement of being near the cutting edge of scientific advancement However graduates trained in molecular biology and cell manipulation soon realise that these techniques are only part of the picture Reaping the full benefits of biotechnology requires manufacturing capability involving the large scale processing of biological material Increasingly biotechnologists are being employed by companies to work in co operation with chemical engineers to achieve pragmatic commercial goals For many years aspects of biochemistry and molecular genetics have been included in chemical engineering curricula yet there has been little attempt until recently to teach aspects of engineering applicable to process design to biotechnologists This textbook is the first to present the principles of bioprocess engineering in a way that is accessible to biological scientists Other texts on bioprocess engineering currently available assume that the reader already has engineering training On the other hand chemical engineering textbooks do not consider examples from bioprocessing and are written almost exclusively with the petroleum and chemical industries in mind This publication explains process analysis from an engineering point of view but refers exclusively to the treatment of biological systems Over 170 problems and worked examples encompass a wide range of applications including recombinant cells plant and animal cell cultures immobilised catalysts as well as traditional fermentation systems First book to present the principles of bioprocess engineering in a way that is accessible to biological scientists Explains process analysis from an engineering point of view but uses worked examples relating to biological systems Comprehensive single authored 170 problems and worked examples encompass a wide range of applications involving recombinant plant and animal cell cultures immobilized catalysts and traditional fermentation systems 13 chapters organized according to engineering sub disciplines are grouped in four sections Introduction Material and Energy Balances Physical Processes and Reactions and Reactors Each chapter includes a set of problems and exercises for the student key references and a list of suggestions for further reading Includes useful appendices detailing conversion factors physical and chemical property data steam tables mathematical rules and a list of symbols used Suitable for course adoption follows closely curricula used on most bioprocessing and process biotechnology courses at senior undergraduate and graduate levels

The Principles of Thermal Sciences and Their Application to Engineering John

Clifford Jones, 2000 Energy efficiency a top priority across the range of engineering disciplines requires a thorough understanding and careful application of thermophysical heat transfer Although closely related most texts tend to treat thermodynamics and heat transfer separately The Principles of Thermal Science and Their Application to Engineering unifies the two topics in a unique approach that offers readers a strong practical background in thermal science The author covers virtually the entire field in a single easy to read book Beginning with classical thermodynamics the chapters discuss the First Second and Third Laws of Thermodynamics engine cycles and other topics The focus then shifts to heat transfer with a thorough examination of conduction and convection and exploring various aspects radiation heat transfer Finally the text offers a clear concise introduction to statistical thermodynamics Numerous worked examples complement the text and offer readers a glimpse into problems often encountered in practice in areas ranging from typical heat transfer problems to simulation of energy problems and including questions related to combustion and the environment Ideal for both self study and coursework The Principles of Thermal Science and Their Application to Engineering helps build the foundation needed by engineers in all disciplines and will prove itself particularly valuable for chemical engineers fuel technologists and fire scientists

Handbook of Nutraceuticals Volume II Yashwant Vishnupant Pathak, 2011-05-16 Due in part to an absence of universally accepted standardization methods nutraceuticals and functional foods face regulatory ignorance marketing incompetence and ethical impunity Even though many researchers believe that there is a connection between nutraceuticals and functional foods and reduced health care expenses as well as disease prevent

Handbook of Food Process Modeling and Statistical Quality Control Mustafa Ozilgen, 1998-09-16 Fundamental techniques of mathematical modeling of processes essential to the food industry are explained in this text Instead of concentrating on detailed theoretical analysis and mathematical derivations important mathematical prerequisites are presented in summary tables Readers attention is focused on understanding modeling techniques rather than the finer mathematical points Topics covered include modeling of transport phenomena kinetic processes and food engineering operations Statistical process analysis and quality control as applied to the food industry are also discussed The book s main feature is the large number of worked examples presented throughout Included are examples from almost every conceivable food process most of which are based on real data given in the many references Each example is followed by a clear step by step worked solution

Bioreaction Engineering Principles Jens Nielsen, John Villadsen, Gunnar Lidén, 2012-12-06. This is the second edition of the text *Bioreaction Engineering Principles* by Jens Nielsen and John Villadsen originally published in 1994 by Plenum Press, now part of Kluwer. Time runs fast in Biotechnology and when Kluwer Plenum stopped reprinting the first edition and asked us to make a second revised edition we happily accepted. A text on bioreactions written in the early 1990s will not reflect the enormous development of experimental as well as theoretical aspects of cellular reactions during the past decade. In the preface to the first edition we admitted to be newcomers in the field. One of us (JV) has had 10 more years of job training in biotechnology and the younger author (IN) has now received international recognition for his work with the hottest topics of modern biotechnology. Furthermore we are happy to have induced Gunnar Lidén, professor of chemical reaction engineering at our sister university in Lund, Sweden, to join us as co-author of the second edition. His contribution especially on the chemical engineering aspects of real bioreactors has been of the greatest value. Chapter 8 of the present edition is largely unchanged from the first edition. We wish to thank professor Martin Hjortso from LSU for his substantial help with this chapter.
