TURTLE DISSECTION LAB

Turtles have had over 200 million years to evolve and have outlived the dinosaurs to become one of the **OLDEST LIVING** families in the animal kingdom. The order **CHELONIA** consists of about 250 species of turtles and tortoises. The term *tortoise* is generally reserved for land dwellers, while *turtle* refers to chelonians that live in water.

INTEGUMENT & STRUCTURE:

Because amphibians exchange gases through their skin, it must be moist and thin enough to allow rapid diffusion. One of the drawbacks of this kind of skin is the loss of body water through evaporation. The thick, dry, scaly skin of reptiles is an improvement, because it is water tight. The tough skin of a reptile helps to conserve water and protects the animal against infections, injuries, and the wear and tear associated with living on land. Surface cells fill with **KERATIN**, the same protein that forms your fingernails and hair and bird feathers. Lipids and proteins in the skin keep it watertight.

Look at the turtle's shells. A turtle's protective shell is formed from the fusion of bones from the ribs and vertebrae. The spine and ribs are attached to the shell, so turtles can't really crawl out of their shells like in the cartoons.

The bones of the shell are divided into sections called **SCUTES**, and are covered with skin containing a protein called **KERATIN**.

Scutes have nerve endings, so a turtle can feel something touching its shell. The scutes and the bone underneath can grow allowing the turtle to expand and get larger. Turtles can regenerate damaged scutes, and some scutes have rings similar to growth rings on trees that can be used to estimate age.

The **BRIDGE** along the sides connects the **CARAPACE** (dorsal shell) to the **PLASTRON** (ventral shell).
