Szaniszló, 2013-11-11 The tendency of fungi pathogenic for humans to have shapes in tissue distinct from their usual saprophytic morphologies has fascinated the pathologist and medical mycologist for almost a century A primary reason for this fascination is the possibility that fungal duality of form or dimorphism may be an important virulence factor that allows the zoo pathogenic fungus to survive host defenses A second reason relates to the desire to gain basic insights into the regulation of cellular development and morphogenesis among the etiological agents of human mycoses Many excellent treatises have appeared within the recent past dealing with fungal dimorphism However it is becoming increasingly clear that it may be beyond the capability of one or a few authors to review this subject adequately Instead the ever increasing volume of literature associated with fungal dimorphism and the diversity of fungi now recognized to exhibit a type of dimorphism suggest that a volume comprised of contributions by numerous researchers may be more appropriate This perception provided me with the motivation to compile a multi-author volume
