Chapter 10: Crustal Deformation and Mountain Building Concepts Check

- 1) What is rock deformation? How might a rock body change during deformation?

Deformation is a rock's reaction to stress, which can cause a rock to change its shape or position; most crustal deformation occurs along plate boundaries.

- 2) How is brittle deformation different from ductile deformation?

Brittle Deformation = rock breaks while undergoing elastic strain. Ductile Deformation = rock breaks while undergoing plastic strain.

- 3) List and describe the four factors that affect rock strength.

temperature, confining pressure, fluid pressure, and the length of time the stress is applied.

- 4) Describe Anticlines and Synclines

Anticlines-An anticline is a fold that is convex upward

Synclines- a syncline is a fold that is concave upward

- 4) What types of faults are associated with fault-block mountains?

Normal faults.

- 5) Define Orogenesis

the formation of mountain ranges by intense upward displacement of the earth's crust, usually associated with folding, thrust faulting, and other compressional processes.

- 6) What is Isostasy?

the rising or settling of a portion of the Earth's lithosphere occurs when weight is removed or added to maintain equilibrium between buoyancy forces that push the lithosphere upward and gravity forces that pull the lithosphere downward.

- 7) What is a passive continental margin? Give an example.

A passive continental margin occurs where the transition from land to sea is not associated with a plate boundary. The east coast of the United States is a good example; the plate boundary is located along the mid-Atlantic ridge, far from the coast.

- 9) What is an Active continental margin? Give an example.

Agterberg, 2014-07-14 This book provides a wealth of geomathematical case history studies performed by the author during his career at the Ministry of Natural Resources Canada Geological Survey of Canada NRCan GSC Several of the techniques newly developed by the author and colleagues that are described in this book have become widely adopted not only for further research by geomathematical colleagues but by government organizations and industry worldwide These include Weights of Evidence modelling mineral resource estimation technology trend surface analysis automatic stratigraphic correlation and nonlinear geochemical exploration methods The author has developed maximum likelihood methodology and spline fitting techniques for the construction of the international numerical geologic timescale He has introduced the

application of new theory of fractals and multi fractals in the geostatistical evaluation of regional mineral resources and ore reserves and to study the spatial distribution of metals in rocks The book also contains sections deemed important by the author but that have not been widely adopted because they require further research These include the geometry of preferred orientations of contours and edge effects on maps time series analysis of Quaternary retreating ice sheet related sedimentary data estimation of first and last appearances of fossil taxa from frequency distributions of their observed first and last occurrences tectonic reactivation along pre existing schistosity planes in fold belts use of the grouped jackknife method for bias reduction in geometrical extrapolations and new applications of the theory of permanent volume independent frequency distributions

Introduction to Geochemistry Kula C. Misra, 2012-05-21 This book is intended to serve as a text for an introductory course in geochemistry for undergraduate graduate students with at least an elementary level background in earth sciences chemistry and mathematics The text containing 83 tables and 181 figures covers a wide variety of topics ranging from atomic structure to chemical and isotopic equilibria to modern biogeochemical cycles which are divided into four interrelated parts Crystal Chemistry Chemical Reactions and biochemical reactions involving bacteria Isotope Geochemistry radiogenic and stable isotopes and The Earth Supersystem which includes discussions pertinent to the evolution of the solid Earth the atmosphere and the hydrosphere In keeping with the modern trend in the field of geochemistry the book emphasizes computational techniques by developing appropriate mathematical relations solving a variety of problems to illustrate application of the mathematical relations and leaving a set of questions at the end of each chapter to be solved by students However so as not to interrupt the flow of the text involved chemical concepts and mathematical derivations are separated in the form of boxes Supplementary materials are packaged into ten appendixes that include a standard state 298 15 K 1 bar thermodynamic data table and a listing of answers to selected chapter end questions Additional resources for this book can be found at www.wiley.com/go/misra_geochemistry

Earth, Our Living Planet Philippe Bertrand,Louis Legendre,2021-04-21 Earth is to our knowledge the only life bearing body in the Solar System This extraordinary characteristic dates back almost 4 billion years How to explain that Earth is teeming with organisms and that this has lasted for so long What makes Earth different from its sister planets Mars and Venus The habitability of a planet is its capacity to allow the emergence of organisms What astronomical and geological conditions concurred to make Earth habitable 4 billion years ago and how has it remained habitable since What have been the respective roles of non biological and biological characteristics in maintaining the habitability of Earth This unique book answers the above questions by considering the roles of organisms and ecosystems in the Earth System which is made of the non living and living components of the planet Organisms have progressively occupied all the habitats of the planet diversifying into countless life forms and developing enormous biomasses over the past 3 6 billion years In this way organisms and ecosystems took over the Earth System and
