Virtual Crowds Mubbasir Kapadia,Nuria Pelechano,Jan Allbeck,Norm Badler,2022-05-31 This volume presents novel computational models for representing digital humans and their interactions with other virtual characters and meaningful environments In this context we describe efficient algorithms to animate control and author human like agents having their

own set of unique capabilities personalities and desires We begin with the lowest level of footstep determination to steer agents in collision free paths Steering choices are controlled by navigation in complex environments including multi domain planning with dynamically changing situations Virtual agents are given perceptual capabilities analogous to those of real people including sound perception multi sense attention and understanding of environment semantics which affect their behavior choices The roles and impacts of individual attributes such as memory and personality are explored The animation challenges of integrating a number of simultaneous behavior and movement demands on an agent are addressed through an open source software system Finally the creation of stories and narratives with groups of agents subject to planning and environmental constraints culminates the presentation

Wang Tiles in Computer Graphics Ares Lagae,2022-06-01 Many complex signals in computer graphics such as point distributions and textures cannot be efficiently synthesized and stored This book presents tile based methods based on Wang tiles and corner tiles to solve both these problems Instead of synthesizing a complex signal when needed the signal is synthesized beforehand over a small set of Wang tiles or corner tiles Arbitrary large amounts of that signal can then efficiently be generated when needed by generating a stochastic tiling and storing only a small set of tiles reduces storage requirements A tile based method for generating a complex signal consists of a method for synthesizing the signal over a set of Wang tiles or corner tiles and a method for generating a stochastic tiling using the set of tiles The method for generating a stochastic tiling using the set of tiles is independent of the signal This book covers scanline stochastic tiling algorithms and direct stochastic tiling algorithms for Wang tiles and corner tiles The method for synthesizing the signal over a set of tiles is dependent on the signal This book covers tile based methods for texture synthesis and for generating Poisson disk distributions This book also explores several applications such as tile based texture mapping and procedural modeling and texturing Although the methods for constructing a complex signal over a set of Wang tiles or corner tiles are dependent on the signal the general idea behind these methods generalizes to other kinds of signals The methods presented in this book therefore have the potential to make the generation and storage of almost any complex signal efficient Table of Contents Introduction Wang Tiles and Corner Tiles Tiling Algorithms for Wang Tiles and Corner Tiles Tile Based Methods for Texture Synthesis Tile Based Methods Generating Poisson Disk Distributions Applications of Poisson Disk Distributions

Practical Global Illumination with Irradiance Caching Jaroslav Krivanek,Pascal Gautron,2022-05-31 Irradiance caching is a ray tracing based technique for computing global illumination on diffuse surfaces Specifically it addresses the computation of indirect illumination bouncing off one diffuse object onto another The sole purpose of irradiance caching is to make this computation reasonably fast The main idea is to perform the indirect illumination sampling only at a selected set of locations in the scene store the results in a cache and reuse the cached value at other points through fast interpolation This book is for anyone interested in making a production ready implementation of irradiance caching that reliably renders artifact free images Since its invention 20 years ago the irradiance caching

algorithm has been successfully used to accelerate global illumination computation in the Radiance lighting simulation system. Its widespread use had to wait until computers became fast enough to consider global illumination in film production rendering. Since then its use is ubiquitous. Virtually all commercial and open source rendering software base the global illumination computation upon irradiance caching. Although elegant and powerful the algorithm in its basic form often fails to produce artifact free images. Unfortunately practical information on implementing the algorithm is scarce. The main objective of this book is to show the irradiance caching algorithm along with all the details and tricks upon which the success of its practical implementation is dependent. In addition we discuss some extensions of the basic algorithm such as a GPU implementation for interactive global illumination computation and temporal caching that exploits temporal coherence to suppress flickering in animations. Our goal is to show the material without being overly theoretical. However the reader should have some basic understanding of rendering concepts ray tracing in particular. Familiarity with global illumination is useful but not necessary to read this book.

Real-Time Massive Model Rendering Sung-eui

Yoon, Enrico Gobbetti, David Kasik, Dinesh Manocha, 2022-06-01 Interactive display and visualization of large geometric and textured models is becoming a fundamental capability. There are numerous application areas including games movies CAD virtual prototyping and scientific visualization. One of observations about geometric models used in interactive applications is that their model complexity continues to increase because of fundamental advances in 3D modeling simulation and data capture technologies. As computing power increases users take advantage of the algorithmic advances and generate even more complex models and data sets. Therefore there are many cases where we are required to visualize massive models that consist of hundreds of millions of triangles and even billions of triangles. However interactive visualization and handling of such massive models still remains a challenge in computer graphics and visualization. In this monograph we discuss various techniques that enable interactive visualization of massive models. These techniques include visibility computation simplification levels of detail and cache coherent data management. We believe that the combinations of these techniques can make it possible to interactively visualize massive models in commodity hardware.

Introductory Tiling Theory for Computer Graphics Craig Kaplan, 2022-06-01 Tiling theory is an elegant branch of mathematics that has applications in several areas of computer science. The most immediate application area is graphics where tiling theory has been used in the contexts of texture generation sampling theory remeshing and of course the generation of decorative patterns. The combination of a solid theoretical base complete with tantalizing open problems practical algorithmic techniques and exciting applications make tiling theory a worthwhile area of study for practitioners and

students in computer science This synthesis lecture introduces the mathematical and algorithmic foundations of tiling theory to a computer graphics audience The goal is primarily to introduce concepts and terminology clear up common misconceptions and state and apply important results The book also describes some of the algorithms and data structures that allow several aspects of tiling theory to be used in practice Table of Contents Introduction Tiling Basics Symmetry Tilings by Polygons Isohedral Tilings Nonperiodic and Aperiodic Tilings Survey **Interactive Shape Design** Marie-Paule Cani,Takeo Igarashi,Geoff Wyvill,2022-05-31 Providing an intuitive modeling system which would enable us to communicate about any free form shape we have in mind at least as quickly as with real world tools is one of the main challenges of digital shape design The user should ideally be able to create deform and progressively add details to a shape without being aware of the underlying mathematical representation nor being tied by any constraint on the geometrical or topological nature of the model This book presents the field of interactive shape design from this perspective Since interactively creating a shape builds on the humans ability of modeling by gesture we note that the recent advances in interactive shape design can be classified as those that rely on sculpting as opposed to sketching metaphors Our synthetic presentation of these strategies enables us to compare the different families of solutions discuss open issues and identify directions for future research Table of Contents Introduction Sculpting Metaphors Sketching Systems Future Directions Modeling by Gesture **An Introduction to Laplacian Spectral Distances and Kernels** Giuseppe Patanè,2022-05-31 In geometry processing and shape analysis several applications have been addressed through the properties of the Laplacian spectral kernels and distances such as commute time biharmonic diffusion and wave distances Within this context this book is intended to provide a common background on the definition and computation of the Laplacian spectral kernels and distances for geometry processing and shape analysis To this end we define a unified representation of the isotropic and anisotropic discrete Laplacian operator on surfaces and volumes then we introduce the associated differential equations i e the harmonic equation the Laplacian eigenproblem and the heat equation Filtering the Laplacian spectrum we introduce the Laplacian spectral distances which generalize the commute time biharmonic diffusion and wave distances and their discretization in terms of the Laplacian spectrum As main applications we discuss the design of smooth functions and the Laplacian smoothing of noisy scalar functions All the reviewed numerical schemes are discussed and compared in terms of robustness approximation accuracy and computational cost thus supporting the reader in the selection of the most appropriate with respect to shape representation computational resources and target application *Efficient Quadrature Rules for Illumination Integrals* Ricardo Marques,Christian Bouville,Luís Paulo Santos,Kadi Bouatouch,2022-06-01 Rendering photorealistic images is a costly process which can take up to several days in the case of high quality images In most cases the task of sampling the incident radiance function to evaluate the illumination integral is responsible for an important share of the computation time Therefore to reach acceptable rendering times the illumination integral must be evaluated using a

limited set of samples Such a restriction raises the question of how to obtain the most accurate approximation possible with such a limited set of samples One must thus ensure that sampling produces the highest amount of information possible by carefully placing and weighting the limited set of samples Furthermore the integral evaluation should take into account not only the information brought by sampling but also possible information available prior to sampling such as the integrand smoothness This idea of sparse information and the need to fully exploit the little information available is present throughout this book The presented methods correspond to the state of the art solutions in computer graphics and take into account information which had so far been underexploited or even neglected by the previous approaches The intended audiences are Ph D students and researchers in the field of realistic image synthesis or global illumination algorithms or any person with a solid background in graphics and numerical techniques

Rethinking Quaternions Ron Goldman, 2022-05-31 Quaternion multiplication can be used to rotate vectors in three dimensions Therefore in computer graphics quaternions have three principal applications to increase speed and reduce storage for calculations involving rotations to avoid distortions arising from numerical inaccuracies caused by floating point computations with rotations and to interpolate between two rotations for key frame animation Yet while the formal algebra of quaternions is well known in the graphics community the derivations of the formulas for this algebra and the geometric principles underlying this algebra are not well understood The goals of this monograph are to provide a fresh geometric interpretation for quaternions appropriate for contemporary computer graphics based on mass points to present better ways to visualize quaternions and the effect of quaternion multiplication on points and vectors in three dimensions using insights from the algebra and geometry of multiplication in the complex plane to derive the formula for quaternion
