

Summary

In this module, you learned how to use the **Make development strategy** process to set up a simulation case using observed well data as input. A history case was run with several modifications of the reservoir structure in order to improve the match between observed and simulated outputs. How to set up production development strategies in Petrel was also reviewed as well as how to add additional rules and expanding the wells into groups or subsets of wells.

Module 8 - Simulation Study

Introduction

In this module, you will be given the opportunity to apply most of what you have learned during this course in a more realistic scenario. Each section contains a description of the scenario and a main task. The idea is to let you find your own way. Only a few steps are given in each section because we want you to find your own way of solving the tasks.

Prerequisites

It is recommended to have successfully completed all of the previous modules to take full advantage of this module.

Work flow

1. Prepare and quality check all of the input data required to assembly your base case.
2. Run the base case using the Mandwest reservoir model.
3. Implement a new development strategy involving one producer as an injector well.
4. Create a new injector well to keep the oil performance.
5. Implement again a new development strategy involving the new injector well.
6. Use the Petrel tools to analyze the output and determine the level of improvement between the cases.

Exercise Data

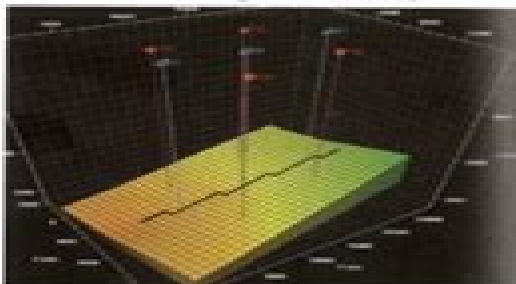

in the following exercises, use the project called **Mandwest.pet** (Dataset > Simulation study folder).

Model Description

The Mandwest reservoir is a variable thickness clastic structure with a major fault running through the center. The reservoir covers an area of 18000 x 24000 ft (5 x 7 km) and is 700 ft thick at the thickest part. The reservoir has been divided into 20 x 30 x 5 ft grid cells yielding a total of 6400 active cells. The reservoir properties are heterogeneous, with the porosity following an increasing trend with depth. The table below lists the minimum and maximum values for the porosity and permeability.

Porosity	0.23-0.31
Permeability (horizontal) wells	275-640
Permeability wells	0.3

The development scheme for this field uses a five spot pattern with two additional injectors offset to the North and South in order to cover the extent of the fault. The wells have been completed throughout the reservoir for maximum contact. The figure below illustrates the Mandwest model structure along with the well locations.

Exercises - Simulation study

Prepare all the input data required to assembly your base case

The model contains only two phases, Oil and water. The water contact has been defined at -2220 ft. A sample of the existing fluids in the Mandwest reservoir has been analyzed in the laboratory; the results are shown in the following table:

Crutum depth	-2300 ft
Pressure at crutum depth	2000 psi
Gas gravity	0.77 sp gr
Oil gravity	0.77 deg API
Bubble point pressure	1140 psi
Water salinity	2000 ppm

Reservoir conditions are as follows:

Minimum pressure	1100 psi
Maximum pressure	5000 psi
Temperature	201 deg F
Reference pressure	5000 psi

The saturation function for this reservoir has been created in a different application, and is ready to be imported into your project.

The composition test of this rock has been carried out in the laboratory giving the following results:

Minimum pressure	1100 psi
Maximum pressure	5000 psi
Compressibility	0.000001
Reference pressure	1100
