DESCRIPTION

FUSE BLOCK

The fuse block (Fig. 11-120) is located on the dash shroud at the left side just above the front edge of the floor mat, Fig. 11-121, and has replaceable fuse clips which are serviced separately. An efficient tool for fuse clip removal can be made from a cotter pin approximately 2½ inches long. Cut off long leg even with short leg. File a bevel on the outside of both legs. Spread the pin wide enough to span the fuse clip.

To remove fuse clip, insert cotter pin over center of fuse clip and push in to disengage locking ears on both sides of clip. Continue pushing after ears disengage and fuse clip will come out through fuse block.

NOTE: Fuse and lamp applications can be found in the specification tables at the end of this section.

WIRING HARNESS

The wiring harness routing is positioned to reduce the possibility of damage to the harness. Particular

attention should be given toward making sure that the wiring is not pinched, stretched, or positioned so as to contact any movable parts under the instrument panel. This includes the hand brake, foot brake, ash trays, accelerator linkage, etc.

In the engine compartment the following routing should be checked: wires to generator, wires in clip retainer opposite the carburetor choke heat tube, around regulator, horn relay, battery, starter solenoid, large dash clips, and the large dash grommet.

WIRING CONNECTORS

Wiring connectors have a locking design to insure a tight fit and to prevent them from separating.

NOTE: When servicing the new connector, insert a thin bladed screwdriver between the male and female section to unlock the assembly before pulling it apart.
