The pump assembly is driven by a permanent split capacitor motor. Output coming off the output shaft, mounted to the counter-rotating drive shaft at 3000RPM, when driven by 120V 60Hz AC signal. This motor drives a pump which supplies (cold, filtered) water at the rate of approximately 10 LPM to all three water cells in series.

Draining is accomplished by using a small separate synchronous drain pump mounted to the pump. The drain pump is connected to the pump by a small rubber hose and two mounting plates. A drain valve is located at the discharge end of the drain pump.

The drain valve is connected to the drain pump by a rubber hose and is mounted to the distributor base. The drain valve maintains pressure in the pressurized line filter. The intermediate drain hose is attached by a hose end clamp to the discharge end of the drain filter.

The drain holes must have a long, at 4-inches
length of 1/2 inches in order to ensure proper
drainage.

The main pump is removed by disconnecting both attached hoses and flange, removing the three screws that secure the motor base to the dipswitch base, unscrewing the two screws, and disconnecting the wiring harness connections to the pump assembly.

When the control reference is the "dry" portion of the cycle, the tower fan located in the lower Drying Drum Assembly is actuated. Then, the Vent Assembly located in the top right corner of the tub is actuated. The vent fan draws in the air from outside the tub forcing the hot, humid air out the Side Drying Drum Assembly and into the lower Drying Drum Assembly. Cold air outside air is mixed with hot, humid air entering the tub in their lower Drying Drum Assembly. This raises the temperature and humidity of the air entering the tub through the top and sidepanels. The addition of colder, drier outside air helps to speed evaporation of water from the hot clothes.
