TEK 6.8C: Calculate average speed using distance and time measurements.

- **Motion** is defined as a change in position, relative to an assumed reference point. To decide whether an object is in motion, or measure its rate of motion (speed), we need to pick a **reference point**. Ideally, that reference point should itself not be moving. But that is impossible, because the ground we walk on is part of a moving tectonic plate. Our planet Earth spins on its axis, and orbits around our Sun. Our solar system in turn orbits around the center of the Milky Way Galaxy. Our galaxy moves in relation to other galaxies. In fact, no reference point that we could choose is in fact fixed. But we can *assume* that a reference point, such as a starting line on a running track, is fixed for purposes of measuring motion.
- **Speed** is one measurement of motion. Speed is defined as the distance travelled divided by the time it took to travel that distance. The formula for speed is:

$$\text{Speed} = \frac{\text{Distance}}{\text{Time}}$$

- **Distance** is the length of the path travelled, following all of the turns or curves of the path. Distance is what a car odometer measures, the actual path of travel that the car took, without any notation of direction. For example, if you walk 100 meters forward, and 35 meters backward towards your starting point, the distance you have traveled will be 135 meters, even though you end up at a point 65 meters from the starting point.
- The units used to measure speed vary. The distance units used in science are metric: meters or kilometers. In the United States, the customary units of distance are feet or miles. The time units in either the metric or customary U.S. systems are the same: seconds, minutes or hours. The most common units you will see in science speed problems are meters per second (m/s) or kilometers per hour (km/h). If a marble rolling down a ramp is being measured, meters per second would be the appropriate unit. If the speed of a car on a road is being measured, kilometers per hour would be the best unit.
- There are two ways that we can measure speed: instantaneous speed and average speed. **Instantaneous speed** is the rate of motion at a single instant of time. The speedometer of a car, or the radar gun that police use to see if your speed is below the speed limit, measure instantaneous speed. In practice, instantaneous speed is really an average speed over a very short period of time—for example, one rotation of a car's tire (the odometer) or during the one second between distance measurements of the police radar gun. **Average speed** is the total distance traveled in some trip divided by the total time it took to complete that trip. On a trip from Dallas to Austin, the instantaneous speed at any one time
