## Metric Conversion: Stair-Step Method

The Metric System of measurement is based on multiples of 10. Prefixes are used to indicate what multiple of 10 the base unit is being multiplied by.

The prefix Kilo (k) - means 1000 times.  
The prefix Hecto (h) - means 100 times.  
The prefix Dekka (dk) - means 10 times.  
The prefix Deci (d) - means 0.1 times.  
The prefix Centi (c) - means 0.01 times.  
The prefix Milli (m) - means 0.001 times.

Base Units will include the gram (g), liter (L), and meter (m) and will have no prefix.

To use the Stair-Step method, find the prefix the original measurement starts with. (ex. *milligram*) If there is no prefix, then you are starting with a base unit. Find the step which you wish to make the conversion to. (ex. *decigram*) Count the number of steps you moved, and determine in which direction you moved (left or right). The decimal in your original measurement moves the same number of places as steps you moved and in the same direction. (ex. *milligram* to *decigram* is 2 steps to the left, so 40 *milligrams* = 40 *decigrams*) If the number of steps you move is larger than the number you have, you will have to add zeros to hold the places. (ex. *kilometers* to *meters* is three steps to the right, so 10 *kilometers* would be equal to 10,000 *meters*)

That's all there is to it! You need to be able to count to 6, and know your left from your right!

1) Write the equivalent measurement: (.5 pt each)

*Computer-Assisted Microscopy* John C. Russ, 2012-12-06 The use of computer based image analysis systems for all kinds of images but especially for microscope images has become increasingly widespread in recent years as computer power has increased and costs have dropped Software to perform each of the various tasks described in this book exists now and without doubt additional algorithms to accomplish these same things more efficiently and to perform new kinds of image processing feature discrimination and measurement will continue

to be developed This is likely to be true particularly in the field of three dimensional imaging since new microscopy methods are beginning to be used which can produce such data It is not the intent of this book to train programmers who will assemble their own computer systems and write their own programs Most users require only the barest of knowledge about how to use the computer but the greater their understanding of the various image analysis operations which are possible their advantages and limitations the greater the likelihood of success in their application Likewise the book assumes little in the way of a mathematical background but the researcher with a secure knowledge of appropriate statistical tests will find it easier to put some of these methods into real use and have confidence in the results than one who has less background and experience Supplementary texts and courses in statistics microscopy and specimen preparation are recommended as necessary *Performance Criteria for Photovoltaic Energy Systems* ,1982      **Systems Analysis and Forest Resource**
