

SAFETY CHECK-OUT

After correcting the original service problem, perform the following safety checks before releasing the unit to the customer:

1. Check the chassis/gear input for unsoldered or poorly-soldered connections. Check the entire board surface for solder splatters and bridges.
2. Check the interlock wiring to ensure that no wires are "pooled" or contact high-voltage sections.
3. Look for unsoldered/soldered replacement parts, particularly transistors, that were installed during a previous repair. Point them out to the customer and recommend their replacement.
4. Look for parts which, though functioning, show obvious signs of deterioration. Point them out to the customer and recommend their replacement.
5. Check the line cord for cracks and abrasion. Recommend the replacement of any such line cord to the customer.
6. Check the E₀ voltage to earth is within the value specified.
7. Check the metal film "insulation" inside screws and all other exposed metal parts for AC leakage. Check leakage as described right.

LEAKAGE TEST

The AC leakage from any exposed metal part to earth ground and from all exposed metal parts to any exposed metal part having a metal-to-chassis short (maximum 10 ohm, 500 megohms). Leakage currents can be measured by any one of three methods:

1. A commercial leakage meter such as the Simpson 220 or ECA WT-500X. Follow the manufacturer's instructions on their instruments.
2. A battery-operated AC millivoltmeter. The Iwata Precision 140 digital multimeter is suitable for this job.
3. Measuring the voltage drop across a resistor by means of a VOM or battery-operated AC voltmeter. The "load" resistance is 1.1 k Ω so existing meters must have an accurate low-voltage scale. The Simpson 160 and Sencore 250-40 Td are examples of a VOM that is suitable. Nearly all battery-operated digital multimeters that have a 2 V AC range are suitable. (See Fig. 4.)
