IUTAM Symposium on Impact Biomechanics: From Fundamental Insights to Applications M. D. Gilchrist, 2005-10-13
Substantial fundamental work has been undertaken in the different aspects of impact biomechanics over the past three decades. Much of this has been motivated and undertaken by the automotive industry in its efforts to improve transport safety. More recently, however, it has become apparent that the multidisciplinary synergies which are realised by interactions between engineers, scientists and clinical practitioners will ultimately lead to a greater understanding of the complex interacting phenomena within the human body after it has sustained an impact. In turn, this greater depth of knowledge will provide more fundamental insights into the analysis, diagnosis, treatment and prevention of impact injuries across a broader spectrum of accident environments. The scientific focus of this IUTAM symposium is to address those topics that are centrally important to the biomechanics of impact. These can be grouped into those that are concerned with the different causes of accidents, e.g. transport, occupational and sports injuries; the mechanics involved in accident analysis, e.g. accident investigation, computational modelling techniques; the different types of resulting traumatic injuries, including musculoskeletal, organ, spinal and head injuries; methods of assessing the extent of injury, e.g. injury assessment, injury criteria; constitutive laws for human tissue; and providing protection during an impact, e.g. injury prevention, energy absorption materials and safety devices.

The greatest technological advances for the crash reconstruction community have come in the realms of photogrammetry and digital media analysis. The widespread use of scanning technology has facilitated the implementation of powerful new tools to digitize forensic data, create 3D models and visualize and analyze crash vehicles and environments. The introduction of unmanned aerial systems and standardization of crash data recorders to the crash reconstruction community have enhanced the ability of a crash analyst to visualize and model the components of a crash reconstruction. Because of the technological changes occurring in the industry, many SAE papers have been written to address the validation and use of new tools for collision reconstruction. *Collision Reconstruction Methodologies Volumes 1-12* bring together seminal SAE technical papers surrounding advancements in the crash reconstruction field. Topics featured in the series include Night Vision Study and Photogrammetry, Vehicle Event Data Recorders, Motorcycle, Heavy Vehicle, Bicycle and Pedestrian Accident Reconstruction. The goal is to provide the latest technologies and methodologies being introduced into collision reconstruction, appealing to crash analysts, consultants and safety engineers alike.
