

Processing and Purposes

Sensory Input Processing

Neurons in the brain receive information from sensory organs and process it. These neurons convert the sensory information into electrical signals.

Neurons also participate in motor control, which involves sending signals to muscles to initiate movement. They also play a role in cognitive functions, such as memory and learning.

Types of Neurons

The brain contains four main types of neurons: Sensory Neurons, Interneurons, Motor Neurons, and Efferent Neurons. Sensory Neurons receive information from the environment and send it to the brain. Interneurons connect sensory neurons to motor neurons. Motor Neurons send signals to muscles to initiate movement. Efferent Neurons send signals to other parts of the brain.

Sensory Neurons

Sensory neurons are responsible for receiving information from the environment and sending it to the brain. They have long dendrites that receive signals from sensory organs like the eyes, ears, nose, and tongue. The cell body of a sensory neuron is located in the brain, and the axon extends from the cell body to the sensory organ.

The brain uses sensory neurons to process information from the environment and make decisions about how to respond. Sensory neurons are essential for all of our senses.
