Abstract –This project is based on the idea of maintaining maximum utilization and minimum loss of available energy. The plenty of solar energy available during the day time is stored in a solar cell and the stored energy is used to glow the street lights during the whole night. Also the system provides a power saving mode of operation by adapting the method of automation. A dark sensor and a light sensor provides the automatic "ON"/"OFF" facility to the street lights, so that it will glow automatically when it is required(i.e. when the surrounding will be dark) and it will be turned "OFF" automatically if sufficient light is available in the surrounding. Again the auto intensity control mechanism has been applied by the help of a microcontroller to control the light intensity of the luminaries as per the requirement. Hence the loss of energy due to unnecessary glow of the street lights can be avoided.

Index Terms – PV module, DS1307, intelligent Street light, LDR (Light depending Resistor), IR Sensor (Infra red Sensor).

1. INTRODUCTION

The gradually growing requirement of energy and the limited resource of traditional energy sources has become a challenge for both developed and developing countries. For this reason, in policy makers' agenda, energy efficiency and sustainability are given the first priority for any project to be installed. Solar street lighting system is an effective way to reduce power consumption and CO₂ impact on the environment with the maintenance of the safety standards of the road. Electric street lighting consumes 114 TW h annually, leading to the emission of 69 million tones of CO₂ [1]. By PV (Photovoltaic) effect the solar radiation can be directly converted into electrical energy. This energy is stored in a rechargeable battery and supplied to the luminary when it is required to glow. The system is designed to provide an automatic control facility. This control may be of three types. First one is optical control method, by using light/dark sensor the street lights can be automatically turn "ON" in the evening after dark, turn "OFF" automatically after dawn in the morning, but the night street lighting is too bright and also a wastage of energy [2]. Second one is time control method, in which the lights will be glow time to time automatically as per the adjustment [3] and the third one is time-optical control, in

which the lights will glow automatically from time to time with automatically controlled intensity[4]. Thus the unnecessary power wastage is reduced up to a large extent.

2. POWER SAVING FEATURES OF AUTOMATIC SOLAR STREET LIGHT

The solar street light has been designed after too much research work. Its uniqueness and best features can make it the most preferable choice in rural area. With gradual development in this research, new features are being added to increase the efficiency. The proposed model may be considered as the third generation of street light which is also known as intelligent street light. The intelligent street light control system uses the latest international intelligent street light energy-saving control technology [5]. The main aim behind the research of designing the system is to find a way for maximum utilization of available energy with minimum
