Guaranteed Computational Methods for Self-Adjoint Differential Eigenvalue Problems Xuefeng Liu,2024-06-25 This monograph presents a study of newly developed guaranteed computational methodologies for eigenvalue problems of self adjoint differential operators It focuses on deriving explicit lower and upper bounds for eigenvalues as well as explicit estimations for eigenfunction approximations Such explicit error estimations rely on the finite element method FEM along with a new theory of explicit quantitative error estimation diverging from traditional studies that primarily focus on qualitative results To achieve quantitative error estimation the monograph begins with an extensive analysis of the hypercircle method that is the Prager Synge theorem It introduces a novel a priori error estimation technique based on the hypercircle method This facilitates the explicit estimation of Galerkin projection errors for equations such as Poisson's and Stokes which are crucial for obtaining lower eigenvalue bounds via conforming FEMs A thorough exploration of the fundamental theory of projection based explicit lower eigenvalue bounds under a general setting of eigenvalue problems is also offered This theory is extensively detailed when applied to model eigenvalue problems associated with the Laplace biharmonic Stokes and Steklov differential operators which are solved by either conforming or non conforming FEMs Moreover there is a detailed discussion on the Lehmann Goerisch theorem for the purpose of high precision eigenvalue bounds showing its relationship with previously established theorems such as Lehmann Maehly's method and Kato's bound The implementation details of this theorem with FEMs a topic rarely covered in existing literature are also clarified Lastly the monograph introduces three new algorithms to estimate eigenfunction approximation errors revealing the potency of

classical theorems Algorithm I extends Birkhoff's result that works for simple eigenvalues to handle clustered eigenvalues while Algorithm II generalizes the Davis-Kahan theorem initially designed for strongly formulated eigenvalue problems to address weakly formulated eigenvalue problems Algorithm III utilizes the explicit Galerkin projection error estimation to efficiently handle Galerkin projection based approximations
