

The first stage of the amplifier is a common-emitter stage. The input signal is applied to the base of the transistor through a coupling capacitor. The base is biased by a voltage divider network consisting of two resistors connected to the supply voltage. The emitter is connected to ground through a resistor, and the collector is connected to the supply voltage through a load resistor. The output of this stage is taken from the collector and is coupled to the next stage through another capacitor.

Figure 1

The second stage of the amplifier is a push-pull output stage. This stage is used to drive a load, such as a speaker or a motor. It consists of two transistors, one NPN and one PNP, connected in a push-pull configuration. The inputs to the bases of these transistors are taken from the output of the first stage. The emitters of both transistors are connected to ground, and the collectors are connected to the load. The load is then connected to ground through a resistor.
