

Prolapsed Cord

What is it?

Umbilical cord prolapse occurs when the umbilical cord comes out of the uterus with or before the presenting part of the fetus. It is a relatively rare condition and occurs in fewer than 1% of pregnancies. Cord prolapse is more common in women who have had rupture of their amniotic sac.

CAUSES

- Premature delivery of the baby
- Delivering more than one baby per pregnancy (twins, triplets, etc.)
- Excessive amniotic fluid
- Breech delivery (the baby comes through the birth canal feet first)
- An umbilical cord that is longer than usual

MANAGEMENT

- Manual elevation of the presenting fetal part
- Monitor fetal heart tones
- Repositioning of the mother to be head down with feet elevated
- Filling of the bladder with a foley catheter, or tube through the urethra to elevate the presenting fetal part
- Use of tocolytics (medications to suppress labor) have been proposed, usually in addition to bladder filling rather than a standalone intervention

Occult Cord Prolapse Overt Cord Prolapse

The cord dropping alongside the baby, but may not be seen in advance

The cord coming before the baby's head can come out

DIAGNOSIS

Umbilical cord prolapse should always be considered a possibility when there is a sudden decrease in fetal heart rate or variable decelerations, particularly after the rupture of membranes. With overt prolapses, the diagnosis can be confirmed if the cord can be palpated on vaginal examination. Without overt prolapse, the diagnosis can only be confirmed after a cesarean section, though even then it will not always be evident at time of procedure.

TREATMENTS

- Lift the baby's head off the cord.
- Trendelenburg or knee chest position
- Hyperoxygenate mom
- **Never push the cord back in!**
- Prepare for emergent c-section delivery

NCLEX TIP

If the cord stops pulsating, fetal death has occurred.
