10. Photosynthesis begins when light (energy) strikes photosynthesizing chloroplasts, breaking bonds that connect the electrons.

11. ATP consists of adenine, a 5-carbon sugar called ribose, and three phosphate groups. Within the bonds between the second and third phosphate groups, energy is released.

12. ATP can be compared to a fully-charged battery because both ATP and NADPH contain stored energy. When ATP releases its energy (changed battery/batteries in order to use that energy), it has an additional "charge" of glucose.

13. ATP is much an immediate energy and is very short lived and glucose is much of a storage and can be utilized by ATP molecules (ATP).

14. Photosynthesis begins when light strikes chloroplasts, which can begin a useful battery. Spontaneous reactions that produce most sunlight to produce oxygen. Most of the time the water is split, releasing oxygen.

15.  $6\text{CO}_2 + 12\text{H}_2\text{O} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$  (just replace 6 with 12)

Carbon dioxide is used, but oxygen is released

16. In addition to water and carbon dioxide, photosynthesis requires light and chlorophyll. Light is the energy that drives photosynthesis, and chlorophyll is the pigment that absorbs light. There are two main types of chlorophyll: chlorophyll a and chlorophyll b.

17. In the chloroplast, it is the stroma, the region outside the thylakoid membranes, that is a glucose, a sugar, or carbohydrate. It is a photosynthetic, a source of glucose and proteins that absorb light energy and is located within chloroplasts. Chloroplasts are found in plants and some algae.

18. NADPH (nicotinamide adenine dinucleotide phosphate) is a carrier of high-energy electrons along with a hydrogen ion. This carrier is the NADP+ (nicotinamide). The conversion of NADP+ to NADPH is a redox reaction in which some of the energy of sunlight was for reduction. When NADPH is used, it releases high-energy electrons produced by light absorption in chloroplasts. Chloroplasts contain chlorophyll in the stroma. These high-energy electrons fuel the reaction of photosynthesis that results, producing carbohydrates that glucose.

19. Hydrogen ions are used to power the synthesis of glucose. The high-energy electrons produced by light absorption that power the synthesis and release hydrogen ions as well. Hydrogen ions are used to power the synthesis of glucose. The process is like a battery being used by water.
